PREFACE

The Botswana AIDS Impact Survey III (BAIS III) is the third sexual behavioural survey and was conducted under the auspices of the Central Statistics Office's Programme of Household Surveys. The BAIS III fieldwork took place between 15th July and 22nd October 2008. The study was designed to provide information on topics explicitly related to HIV/AIDS.

In this household survey, a randomly selected sample group of women and men aged 10 – 64 years were interviewed for sexual behavioral data collection while those households within the sample having household members aged 18 months and over were covered with consent to participate in the HIV testing survey. The information was de-linked and made anonymous as the specimen was uniquely bar-coded and submitted to the laboratory for testing.

The BAIS III consultative processes started in 2007 where several meetings were held to discuss instruments development issues and other preparatory activities. In March 2008 the survey instruments were pretested in Gaborone and surrounding areas principally to test their relevance and applicability.

The BAIS III has three major components, namely the Household Questionnaire, the Individual Questionnaire and the Blood Collection Form. The Household Questionnaire was used to list all members of the selected households and their demographic characteristics such as age, sex, orphanhood (0-17 years) and economic activity. The Individual Questionnaire was designed to capture information regarding demographic characteristics, care and support, marriage and cohabiting partnerships, alcohol consumption and drug use, sexual history and behavior, male circumcision and sexually transmitted diseases, knowledge about HIV/AIDS and level of interventions, attitudes towards people with HIV/AIDS, childbearing and antenatal care as well as availability of social and medical services in response to the pandemic. The third component is on the scale of the pandemic. It was designed to collect blood samples from members of households aged 18 months and over for testing and estimation of HIV prevalence and derivation of incidence measures.

This report thus contains information based on the above mentioned components including background information (introduction and survey objectives); survey methodology and sample design and data collection procedures.

We hope that this report will provide useful information for the study of demographic trends and other social and economic indicators.

A. N. Majelantle
Government Statistician
Central Statistics Office

ACKNOWLEDGEMENT

The undertaking of a survey of this magnitude and importance demands a well coordinated performance on several activities from various quarters. Thus, different people were involved with different survey processes, either simultaneously or at different times of the duration of the exercise. Therefore, for effective supervision and co-ordination of these processes, concerted and coordinated efforts among individuals involved, is of vital importance for a successful outcome. Considerable success has been realized in the execution of various survey activities, indicating achievement in coordination and cooperation at all levels.

I will therefore like to take this opportunity to express my appreciation to all those who participated in this Botswana AIDS Impact Survey (BAIS III). I am particularly grateful to the Ministry of Finance and Development Planning through the Central Statistics Office for the pivotal role they played in providing the technical expertise for the success of the survey.

Many thanks go to the **National AIDS Coordinating Agency** for their responsibility in coordination, resource mobilization and logistical support of the survey.

I would also like to acknowledge the **members of the BAIS III Reference Group and the Technical Working Group** for their commitment to the successful completion of the survey, from its planning stage through the development of the survey instruments to the dissemination of the results.

I would also like to extend my sincere gratitude to the members of the public who gave their most valuable time freely and patiently to be interviewed and tested; for without your support the survey would not have been a success.

I would like to convey my appreciation to development partners, in particular United Nations Development Programme (UNDP) and African Comprehensive HIV/AIDS Partnerships (ACHAP) for their support.

Many thanks to the National Health Laboratory for the advice, testing of the blood samples and ensuring the integrity and validity of the test results and also for the development of the laboratory protocol for the survey.

Special thanks go to **Dr Peter Ubomba-Jaswa, the BAIS III Chief Demographer**, for his technical and advisory roles in the fieldwork activities as well as the coordination, tabulation, data processing and analysis and writing of the 2008 BAIS III report; and **Mr. E.P.T. Bulayani, BAIS III Data Processing Consultant**, for designing the BAIS III data entry system and overall processing of the BAIS III data. The Computing Service Unit (CSU) of CSO provided strong back up in the data processing. In this regard Ms Chedza Mahatle played a pivotal role in supervision of data entry, online editing and reconciliation.

I would also like to convey my gratitude CSO, NACA and NHL Subject Matter Specialists as listed below for the pivotal role they played for the success of the survey.

- Dr B. Fidzani, M. Mmesesi, S. Mosweunyane, K. Thamuku from the NACA Research and Monitoring Section.
- Dr. M. Mine, Ms K. Makhaola, Mr K. Mphoyakgosi, Ms T. Nkwane and many others from the National Health Laboratory (NHL)
- Ms A. N. Majelantle, Ms. M. P. Kerekang, Mr. K. Johane, Mr K. Mogotsinyane, Dr. V. K. Dwivedi. Mr. G. Kesupile, Mr. B.S. Tlhomelang, Ms. T. Sediadie from the Central Statistics Office.

Let me take this opportunity also to convey my appreciations to the **Quality Control Officers**, Mr. C. Daman, Mr. V. Makwati, Ms. G. Kesetse and Ms. T. Tsienyane for the quality control measures and implementation of fieldwork activities to ensure that the quality of the collected data is not compromised.

Many thanks to the BAIS III team Supervisors, Enumerators, Data Entry Operators, Coders, Editors and Drivers for working tirelessly collecting and processing the information required; for without their honest efforts we could not boast of a successful survey. I would like to acknowledge the **Central Transport Organisation (CTO)** for providing vehicles and **Drivers** for assisting in the transportation of field personnel.

Finally, I am grateful to **all staff of the CSO, NACA and NHL**; the typists, the personal secretaries, the administrators, supplies officers and the professionals for the dedication and thoroughness in their application to the entire exercise: from its planning stages to its conclusion.

Table 103: Never married population aged 10-64 years that ever had sexual intercourse or never had sexual intercourse by sex, cross-classified by (a) Age group, (b) Educational attainment, (c) Religious Affiliation and (d) Residence - Botswana, 2008.....	174
Table 104: Distribution of population aged 10-64 years that never married and never had a biological child by sex and Ever had sexual intercourse or Never had sexual intercourse, cross-classified by (a) Age group, (b) Educational attainment, (c) Religious Affiliation, and (d) Residence - Botswana, 2008.....	175
Table 105a. Percentage distribution of persons aged 15-49 years who ever had sexual intercourse by sexual partner and condom use, cross-classified by (a) Place of residence, (b) District and (c) Sex - Botswana, 2008.....	176
Table 105b. Percentage distribution of persons aged 15-49 years who ever had sexual intercourse by sexual partner and condom use, cross-classified by (a) Educational attainment and (a) Occupation - Botswana, 2008.....	177
Table 105c. Percentage distribution of persons aged 15-49 years who ever had sexual intercourse by sexual partner and condom use, cross-classified by (a) Age group, (b) Marital status, (c) Relationship to partner - Botswana, 2008.....	178

Table 106: Percentage distribution of <i>Male</i> and <i>Female</i> population aged 15-49 who had sexual intercourse NOT more than 12 months ago by number of people had sexual intercourse with in the <i>last 12 months</i> and in the <i>last ONE month</i> , cross-classified by (a) Age group, (b) Educational Attainment, (c) Religious Affiliation and (d) Residence - Botswana, 2008.....	179
Table 107: Distribution of population aged 15-49 who had sexual intercourse during the last 12 months by sex and whether ALWAYS used a condom with sexual partner,, cross-classified by (a) Most recent sexual partner, (b) Next most recent sexual partner and (c) Second most recent sexual partner.	180
Table 108a: Percentage distribution of population aged 15-49 who had sexual intercourse during the past 12 months by type/nature of relationship with sexual partner(s) and use of condom, cross-classified by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Religious affiliation - Botswana, 2008.....	181
Table 108b: Percentage distribution of population aged 15-49 who had sexual intercourse during the past 12 months by type/nature of relationship with sexual partner(s) and use of condom, cross-classified by (a) Residence, (b) District and (c) Sex - Botswana, 2008	182
Table 109a: Percentage distribution of <i>MALE</i> population aged 15-49 who had sexual intercourse during the past 12 months by type/nature of relationship with sexual partner(s) and use of condom, cross-classified by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Religious affiliation - Botswana, 2008.....	183
Table 109b: Percentage distribution of <i>MALE</i> population aged 15-49 who had sexual intercourse during the past 12 months by type/nature of relationship with sexual partner(s) and use of condom, cross-classified by (a) Residence and (b) District - Botswana, 2008.....	184
Table 110a: Percentage distribution of <i>FEMALE</i> population aged 15-49 who had sexual intercourse during the past 12 months by type/nature of relationship with sexual partner(s) and use of condom, cross-classified by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Religious affiliation - Botswana, 2008	185
Table 110b: Percentage distribution of <i>FEMALE</i> population aged 15-49 who had sexual intercourse during the past 12 months by type/nature of relationship with sexual partner(s) and use of condom, cross-classified by (a) Residence and (b) District - Botswana, 2008	186
Table 111a: Percentage distribution of population aged 15-49 by use of condom the <i>FIRST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008	187
Table 111b: Percentage distribution of population aged 15-49 by use of condom the <i>FIRST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, (b) District, and (c) Sex - Botswana, 2008	188
Table 112a: Percentage distribution of <i>MALE</i> population aged 15-49 by use of condom the <i>FIRST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008.....	189
Table 112b: Percentage distribution of <i>MALE</i> population aged 15-49 by use of condom the <i>FIRST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, (b) District - Botswana, 2008	190
Table 113a: Percentage distribution of <i>FEMALE</i> population aged 15-49 by use of condom the first time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent,</i>	

<i>second most recent</i>), cross-classified by (a) Age , (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008.....	191
Table 113b: Percentage distribution of <i>FEMALE</i> population aged 15-49 by use of condom the first time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, (b) District - Botswana, 2008	192
Table 114a: Percentage distribution of population aged 15-49 years <i>NOT married or living together</i> by use of condom the <i>LAST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008.....	193
Table 114b: Percentage distribution of population aged 15-49 years <i>NOT married or living together</i> by use of condom the <i>LAST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, (b) District, (c) Sex - Botswana, 2008.....	194
Table 115a: Percentage distribution of <i>MALE</i> population aged 15-49 years <i>NOT married or living together</i> by use of condom the <i>LAST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008....	195
Table 115b: Percentage distribution of <i>MALE</i> population aged 15-49 years <i>NOT married or living together</i> by use of condom the <i>LAST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, (b) District - Botswana, 2008.....	196
Table 116a: Percentage distribution of <i>FEMALE</i> population aged 15-49 years <i>NOT married or living together</i> by use of condom the <i>LAST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008.....	197
Table 116b: Percentage distribution of <i>FEMALE</i> population aged 15-49 years <i>NOT married or living together</i> by use of the <i>LAST</i> time they had sexual intercourse with a different sexual partner (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, (b) District - Botswana, 2008.....	198
Table 117a: Distribution of persons aged 15-49 years who were drunk before the last sexual intercourse by use of condom the <i>LAST</i> time they had sexual intercourse with sexual partner(s) (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008.....	199
Table 117b: Distribution of persons aged 15-49 years who were drunk before the last sexual intercourse by use of condom the <i>LAST</i> time they had sex with sexual partners (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, and (b) District - Botswana, 2008	200
Table 118a: Distribution of <i>MALES</i> aged 15-49 years who were drunk before the last sexual intercourse by use of condom the <i>LAST</i> time they had sex with sexual partners (<i>most recent, next most recent, second most recent</i>), cross-claffied by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008.....	201
Table 118b: Distribution of <i>MALES</i> aged 15-49 years who were drunk before the last sexual intercourse by use of condom the <i>LAST</i> time they had sex with sexual partners (<i>most recent, next most recent, second most recent</i>), cross-classified by (a) Residence, and (b) District - Botswana, 2008	202

Table 119a: Distribution of <i>FEMALES</i> aged 15-49 years who were drunk before the last sexual intercourse by use of condom the LAST time they had sex with sexual partners (most recent, next most recent, second most recent), cross-classified by (a) Age, (b) Educational attainment, (c) Marital status, and (d) Religious affiliation - Botswana, 2008	203
Table 119b: Distribution of <i>FEMALES</i> aged 15-49 years who were drunk before the last sexual intercourse by use of condom the LAST time they had sexual intercourse with sexual partners (most recent, next most recent, second most recent), cross-classified by (a) Residence, and (b) District - Botswana, 2008.....	204
Table 120a: Distribution of MALE population aged 10-64 by circumcision status, cross-classified by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Religious affiliation - Botswana, 2008.....	205
Table 120b: Distribution of MALE population aged 10-64 by circumcision status, cross-classified by (a) Residence, (b) District - Botswana, 2008.....	206
Table 121a. Percentage distribution of persons 10-64 years who have ever heard of STI's by signs/symptoms in a WOMAN that would lead them to think that she has an STI, cross-classified by (a) Residence, (b) District, and (c) Sex - Botswana, 2008	207
Table 121b. Percentage distribution of persons 10-64 years who have ever heard of STI's by signs/symptoms in a WOMAN that would lead them to think that she has an STI, cross-classified by (a) Marital status, (b) Educational attainment, (c) Age group, and (d) Occupation - Botswana, 2008.....	208
Table 122a. Percentage distribution of persons 10-64 years who have ever heard of STI's by signs/symptoms in a MAN that would lead them to think that he has an STI, cross-classified by (a) Residence, (b) District, and (c) Sex - Botswana, 2008	209
Table 122b. Percentage distribution of population 10-64 years who have ever heard of STI's by signs/symptoms in a MAN that would lead them to think that he has an STI, cross-classified by (a) Marital status, (b) Level of Education, (c) Age group, and (d) Occupation - Botswana, 2008	210
Table 123a. Percentage distribution of population 10-64 years who have ever heard of STIs by identification of "Where someone can go to get treatment for STIs", cross-classified by (a) Residence, (b) District, and (c) Sex - Botswana, 2008.....	211
Table 123b. Percentage distribution of persons 10-64 years who have ever heard of STIs by identification of "Where someone can go to get treatment for STI's" cross-classified by (a) Marital status, (b) Educational attainment, (c) Age group and (d) Occupation - Botswana, 2008	212
Table 124(a) .Distribution of persons 10-64 years who had sexual intercourse during the past 12 months with genital DISCHARGE and genital ULCERS/OPEN SORES by Sex, cross-classified by (a) Residence, and (b) District - Botswana, 2008	213
Table 124(b): Percentage distribution of persons 10-64 years ever had sexual intercourse during the past12 months with genital DISCHARGE and genital ULCERS/OPEN SORES by Sex, cross-classified by (a) Marital status, (b) Highest level of school, (c) Age group, and (d) Occupation - Botswana, 2008.....	214
Table 125(a). Percentage distribution of persons aged 10-64 years who, in the past 12 months, had sexual intercourse and also had symptoms of STI's by indication of "where someone can go for advice on STIs", cross-classified by (a) Residence, (b) District, and (c) Sex - Botswana, 2008	215

Table 125(b). Percentage distribution of persons aged 10-64 years who, in the past 12 months, had sexual intercourse and also had symptoms of STI's by indication of "Where someone can go for advice on STI's", categorized by (a) Marital status, (b) Educational attainment, (c) Age group, and (d) Occupation group - Botswana, 2008	216
Table 126a: Percentage distribution of population 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of ways of preventing HIV infection, cross-classified by (a) Residence, and (b) District - Botswana, 2008	217
Table 126b: Percentage distribution of population 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of ways of preventing HIV infection, cross-classified by (a) Sex, (b) Marital status, (c) Age group, (d) Educational attainment - Botswana, 2008	218
Table 127a: Percentage distribution of <i>MALE</i> population 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of ways of preventing HIV infection, cross-classified by (a) Residence, and (b) District - Botswana, 2008.....	219
Table 127b: Percentage distribution of <i>MALE</i> population 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of ways of preventing HIV infection, cross-classified by (a) Marital status, (b) Age group, (c) Level of education - Botswana, 2008.....	220
Table 128a: Percentage distribution of <i>FEMALE</i> population 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of ways of preventing HIV infection, cross-classified by (a) Residence, (b) District - Botswana, 2008	221
Table 128b. Percentage distribution of <i>FEMALE</i> population 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of ways of preventing HIV infection, cross-classified by (a) Marital status, (b) Age group, (c) Level of education - Botswana, 2008	222
Table 129a. Percentage distributions of persons aged 10-64 years who "ever heard of the virus HIV or an illness called AIDS" by knowledge of "ways to prevent becoming infected with the HIV", cross-classified by (a) Residence, (b) District, and (c) Sex - Botswana, 2008	223
Table 129b. Percentage distributions of persons aged 10-64 years who "ever heard of the virus HIV or an illness called AIDS" by knowledge of "ways to prevent becoming infected with the HIV", cross-classified by (a) Marital status, (b) Age group, (c) Educational attainment, and (d) Occupation - Botswana, 2008.....	224
Table 130a: Percentage distribution of population aged 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of misconceptions about HIV transmission, cross-classified by (a) Residence, (b) District, (c) Sex, Age - Botswana, 2008.....	225
Table 130b. Percentage distribution of population aged 10-64 years ever heard of the virus HIV or an illness called AIDS by identification of misconceptions about HIV transmission, cross-classified by (a) Marital status, (b) Age group, (c) Educational attainment, and (d) Occupation - Botswana, 2008.....	226
Table 131a: Percentage distribution of persons aged 10-64 years who say HIV & AIDS can be transmitted from a mother to a child by identification of means of transmission from mother to child, cross-classified by (a) Residence, (b) District, (c) Sex - Botswana, 2008	227
Table 131b. Percentage distribution of persons aged 10-64 years who say HIV & AIDS can be transmitted from a mother to a child by identification of means of transmission from mother to child, cross-classified by (a) Marital status, (b) Age group, (c) Educational attainment and (d) Occupation - Botswana, 2008.....	228
Table 132a. Percentage distribution of <i>FEMALE</i> population aged 10-64 years who say HIV & AIDS can be transmitted from a mother to a child by identification of means of transmission from mother to child, cross-classified by (a) Residence, and (b) District, - Botswana, 2008	229

Table 132b: Percentage distribution of <i>FEMALE</i> population aged 10-64 years who say HIV & AIDS can be transmitted from a mother to a child by identification of means of transmission from mother to child, cross-classified by (a) Marital status, (b) Age group, (c) Educational attainment and (d) Occupation – Botswana, 2008.....	230
Table 133a: Percentage distribution of population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to an <i>UNBORN BABY</i> by identification of ways to avoid transmission, cross-classified by (a) Residence, (b) District, (c) Sex - Botswana, 2008.....	231
Table 133b. Percentage distribution of population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to an <i>UNBORN BABY</i> by identification of ways to avoid transmission, cross-classified by (a) Marital status, (b) Age group, (c) Educational attainment, and (d) Occupation - Botswana, 2008	232
Table 134a: Percentage distribution of <i>FEMALE</i> population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to an <i>UNBORN BABY</i> by identification of ways to avoid transmission, cross-classified by (a) Residence, (b) District, (c) Sex - Botswana, 2008	233
Table 134b. Percentage distribution of <i>FEMALE</i> population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to an <i>UNBORN BABY</i> by identification of ways to avoid transmission, cross-classified by (a) Marital status, (b) Age group, (c) Educational attainment, and (d) Occupation - Botswana, 2008.....	234
Table 135a. Percentage distribution of population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to a <i>NEWBORN BABY</i> by identification of ways to avoid transmission, cross-classified by (a) Residence, (b) District, (c) Sex - Botswana, 2008.....	235
Table 135b: Percentage distribution of population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to a <i>NEWBORN BABY</i> by identification of ways to avoid transmission, categorized by (a) Marital status, (b) Age group, (c) Educational attainment , and (d) Occupation - Botswana, 2008	236
Table 136a: Percentage distribution of <i>FEMALE</i> population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to a <i>NEWBORN BABY</i> by identification of ways to avoid transmission, cross-classified by (a) Residence, and (b) District, - Botswana, 2008.....	237
Table 136b: Percentage distribution of <i>FEMALE</i> population aged 10-64 years who say there are ways an infected mother can avoid HIV transmission to a <i>NEWBORN BABY</i> by identification of ways to avoid transmission, cross-classified by (a) Marital status, (b) Age group, (c) Educational attainment, and (d) Occupation - Botswana, 2008	238
Table 137a. Population aged 10-64 years aware of ARV's by Belief about ARVs as cure for AIDS by Sex, cross-classified by (a) Age group, (b) Educational attainment, (c) Marital status and (d) Residence - Botswana, 2008	239
Table 137b. Population aged 10-64 years aware of ARV's by whether they think that people on ARVs should always use condoms by sex, cross-classified by (a) Age group, (b) Educational attainment, (c) Marital status and (d) Residence - Botswana, 2008.....	240
Table 138a: Percentage distribution of population aged 10-64 years ever heard of the virus HIV or an illness called AIDS who say "It is possible for a healthy looking person to have HIV" by Sex and identification of three main ways of preventing sexual transmission of HIV, categorized by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Residence - Botswana, 2008	241

Table 138b: Percentage distribution of persons aged 10-64 years ever heard of the virus HIV or an illness called AIDS who think that "A person cannot get infected with HIV & AIDS through mosquito bites" by Sex and identification of three main ways of preventing sexual transmission of HIV, categorized by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Residence - Botswana, 2008	242
Table 139a: Percentage distribution of persons aged 10-64 years ever heard of the virus HIV or an illness called AIDS who think that "A person cannot get infected with HIV & AIDS through mosquito bites" by Sex and identification of three main ways of preventing sexual transmission of HIV, categorized by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Residence - Botswana, 2008	243
Table 138b: Percentage distribution of persons aged 10-64 years ever heard of the virus HIV or an illness called AIDS who think that "A person cannot get infected with HIV & AIDS through mosquito bites" by Sex and identification of three main ways of preventing sexual transmission of HIV, categorized by (a) Age group, (b) Educational attainment, (c) Marital status, (d) Residence - Botswana, 2008	244
Table 140: Percentage distribution of population aged 10-64 who ever heard of the virus HIV or an illness called AIDS by knowledge that a healthy looking person can have HIV while also correctly rejecting major misconceptions about transmission of HIV, cross-classified by (a) Age group, (b) Residence, (c) Educational attainment, (d) Marital status, and (e) Religious affiliation - Botswana, 2008.....	245
Table 141a: Percentage distribution or persons aged aged 10-64 years "ever heard of the virus HIV or an illness called AIDS and say there are ways an infected mother can avoid transmission of HIV to unborn/newborn baby" by Sex and identification of ways infected mother can avoid transmission, categorized by (a) Age group, (b) Educational attainment, (c) Marital status and (d) Religious affiliation -Botswana, 2008	246
Table 141b: Percentage distribution or persons aged aged 10-64 years "ever heard of the virus HIV or an illness called AIDS and say there are ways an infected mother can avoid transmission of HIV to unborn/newborn baby" by Sex and identification of ways infected mother can avoid transmission, categorized by (a) Residence and (b) District -Botswana, 2008	247
Table 142a: Percentage distribution of population aged 10-64 who have ever heard of the virus HIV or an illness called AIDS by Sex and rejection of the misconceptions about HIV transmission through Mosquito bites and Witchcraft, cross-classified by (a) Age group, (b) Residence - Botswana, 2008.....	248
Table 142b: Percentage distribution of population aged 10-64 who have ever heard of the virus HIV or an illness called AIDS by Sex and rejection of the misconceptions about HIV transmission through Mosquito bites and Witchcraft, cross-classified by (a) Educational attainment, (b) Marital status and (c) Religious affiliation - Botswana, 2008	249
Table 143a: Percentage distribution of population aged 10-64 years who have ever heard of the virus HIV or an illness called AIDS by Sex by rejection of the misconceptions about HIV transmission through Mosquito bites and Witch-craft and also know that healthy looking people can be HIV, cross-classified by (a) Age group, and (b) Residence.	250
Table 143b: Percentage distribution of population aged 10-64 who have ever heard of the virus HIV or an illness called AIDS by sex by rejection of the misconceptions about HIV transmission through Mosquito bites and Witchcraft and also know that a healthy looking person can have HI, cross-classified by (a) Educational attainment, (b) Marital status and (c) Religious affiliation - Botswana, 2008.....	251

Table 144a: Percentage distribution of population aged 10-64 years aware of ARV's by sex by "Belief about ARV's as cure for AIDS", and by whether they "... think that people on ARVs should always use condoms", cross-classified by (a) Age group, (b) Educational attainment, (c) Marital status and (d) Religious affiliation – Botswana, 2008.	252
Table 144b: Percentage distribution of population aged 10-64 years aware of ARV's by sex by "Belief about ARV's as cure for AIDS", and by whether they "... think that people on ARVs should always use condoms", cross-classified by (a) Residence and (b) District., Botswana 2008.....	253
Table 145a: Distribution of persons aged 10-64 years who ever heard of the virus HIV or an illness called AIDS by attitude toward people living with HIV and AIDS, categorized by (a) Residence, (b) District, and (c) Religion - Botswana, 2008.....	254

CHAPTER 1: BACKGROUND, RATIONALE AND OBJECTIVES

1.1 *Introductory Background*

In Botswana, HIV surveillance has been conducted since 1992 in Public Health Facilities among pregnant women and men having signs of sexually transmitted infections (STIs). However, as a result of difficulties in attaining adequate sample sizes from men with STIs, from 2002, the ANC Sentinel Surveillance included only pregnant women. While the surveys provided valuable data on the prevalence of HIV in the country, they were limited in providing information on risk factors for contracting HIV. For many years, the World Health Organization (WHO) and the Joint United Nations Programme on AIDS (UNAIDS) have advocated for the adoption of second generation surveillance as a strategy for addressing some of the limitations of the HIV sentinel surveys. In particular, the importance of using behavioral data to inform and explain trends recorded in HIV infection was not emphasized and advocated for. But since 2000 a number of behavioral surveys (for example: the 2000 Botswana Multiple Indicator Survey, the 2001 Sexual Behavior of Young People in Botswana Survey, the 2001 Botswana AIDS Impact Survey I (BAIS I) and the 2004 Botswana AIDS Impact Survey II (BAIS II) have been conducted in Botswana in an attempt to address some of the limitations of HIV sentinel surveys. These surveys have produced important population-based estimates of HIV/AIDS on the knowledge, attitudes, behavior and practice of the population in Botswana. Precise estimates of sexual risk behaviors, AIDS knowledge and prevention behaviors, and other relevant indicators are required. Also required is the need to know more about recent developments in the social and behavioral sciences. To these ends, NACA has developed indicators to measure for behavioral change, and the measurement of these indicators would be most useful for the various intervention programs that are in place or that will be put in place in the near future.

The 2001 BAIS I was Botswana's first national population based household sexual behavioral survey. The survey was a base line conducted to obtain more information on topics related to HIV/AIDS. During this base line survey, no HIV testing was undertaken. In 2004 the second sexual behavioural national population level survey, the 2004 BAIS II was implemented. It was designed to identify and measure factors (behavior, knowledge, attitudes and cultural influences) that are associated with HIV epidemic in Botswana. The 2004 BAIS II focused on issues related to the prevention and impact of HIV/AIDS amongst the population aged 10-64, and also estimated HIV prevalence amongst the population aged 18 months and above. The 2004 BAIS II documented significant improvement in many of the standard HIV/AIDS indicators, including an increase in knowledge about the ways HIV is transmitted, greater use of condoms, and increased use of Voluntary Counseling and Testing (VCT). The survey also showed HIV infection prevalence rates of 17.6 percent among those aged 18 months and over and 25.0 percent among those aged 15-49 years.

The formulation of effective national responses that address the multifaceted consequences of HIV/AIDS is primarily dependent on the ability of the surveillance system to provide accurate and timely information on the magnitude and distribution of HIV/AIDS and related behavioral risk factors. UNAIDS and WHO recommend that a representative sample of the general population should be included in the HIV second-generation surveillance systems in countries with a generalized epidemic, in order to provide: a) reliable measures of HIV prevalence for women and men and b) information to calibrate the data resulting from the routine HIV surveillance systems.

In an effort to continue to have concomitant information that reliably tracks behavioural traits and changes which impact the spread of the HIV, and those that give a better national picture of the prevalence rate within the country, the third sexual behavioural national population level survey; the BAIS III has now taken place in 2008. The 2008 BAIS III was the second population level survey aimed at not only assessing knowledge, attitude and behavior regarding HIV and AIDS, but also determining the HIV prevalence and incidence rates among the general population aged 18 months and above. Incorporating testing for HIV in the BAIS III affords

the opportunity to link the prevalence results to the other data including numerous knowledge and behavioral indicators. The results of 2008 BAIS III will therefore allow us to assess trends in prevalence rates and behavioral risk factors and provide status update of national and international indicators since the 2001 BAIS I. It will also be used to critically assess the impact of national program performance and provide the basis for evidence based strategic planning and future research.

1.2 Survey Rationale and Objectives

The primary objective of the 2008 BAIS III was to update current information on the behavioral patterns of the populations aged 10-64 years and the HIV prevalence and incidence rates among those aged 18 months and above at national, district and sub-district level. This information will be used for continuous strategic prevention and national HIV program planning and future HIV and AIDS research. Specifically, the survey was intended to provide:

- i. current national HIV prevalence and incidence estimates among the population aged 18 months and above;
- ii. indicative trends in sexual and preventive behavior among the population aged 10-64 years;
- iii. a comparison between HIV rate, behavior, knowledge, attitude, and cultural factors that are associated with the epidemic with estimates derived from previous surveys; and
- iv. information on demographic, socio-economic, housing and household members' conditions associated with and/or are determinants and consequences of the pandemic.

A related objective is to produce survey results in a timely manner and ensure that the data are disseminated to a wide audience of potential users in government and non-governmental organizations within and outside Botswana as part of facilitation of broader effort to strengthen strategies aimed at combating the disease.

CHAPTER 2: SURVEY METHODOLOGY

The 2008 Botswana AIDS Impact Survey III (BAIS III) was designed to provide a comparison (trend) between HIV prevalence rate, behavior, knowledge, attitude, and other factors that are associated with the epidemic with estimates derived from previous survey, i.e. 2004 BAIS II.

The survey methodology in brief is given below. However the details about the survey methodology are given in Appendix-B.

2.1 Sampling Frame

For BAIS-II the sampling frame based on the 2001 Population and Housing Census. This comprised the list of all Enumeration Areas (EAs) together with number of households. In 2001 Census the EAs were framed of manageable size (in terms of dwellings/households). So the primary sampling units (PSUs) were EAs.

2.2 Stratification

Stratification was undertaken such that all districts and major urban centres become their own strata. With regard to increase precision consideration was also given to group EAs according to ecological zones in rural districts and according to income categories in cities/towns. Geographical stratification along ecological zones and income categories was expected to improve the accuracy of survey data in view that homogeneity of the variables within stratum was relatively high.

2.3 Sample Design

A stratified two-stage probability sample design was used for the selection of the sample.

The **first stage** was the selection of EAs as Primary Sampling Units (PSUs) selected with probability proportional to measures of size (PPS), where measures of size (MOS) were the number of households in the EA as defined by the 2001 Population and Housing Census. In all 459 EAs were selected with probability proportional to size.

At the **second stage** of sampling, the households were systematically selected from fresh list of occupied households prepared at the beginning of the survey's fieldwork (i.e. listing of households for the selected EAs). Overall 8,275 households were drawn systematically.

2.4 Questionnaires and Coverage

The questionnaires are the primary recording documents of the survey. In the development of the questionnaires, along with the professionals, the other members (Including some users) were also invited. The final version of the questionnaires was finalized on the basis of the experiences gained from the pre test conducted using the drafted questionnaires for the survey. The 2008 BAIS III consisted of two questionnaires, namely

- i. The Household Questionnaire
- ii. The Individual Questionnaire

2.5 Fieldwork and Data Processing

Among the trainees 50 supervisors were trained over a period of two weeks from the 19th– 30th May 2008. The other group of trainees was two hundred and ninety (290) enumerators trained over a period of four weeks (2nd–30th June 2008) with supervisors. Of these 290 enumerators 250 were recruited, among which some were designated for coding and editing duties.

There was a total of 300 field staff comprising 50 supervisors and 250 enumerators. Of the 50 supervisors, 18 supervisors were permanent Central Statistics Office staff whereas 32 were on temporary contract. A total of 50 teams were engaged in the field work exercise and each team comprised 2 drivers, 4 enumerators, and a supervisor. Depending on the workload and type of terrain some of the teams had five enumerators. At least 9 EAs were assigned to each team during the course of the survey. Six officers who were responsible for the quality control field visited and supported the teams and the data collection period was from the 15th July to the 22nd October, 2008.

Before data entry was carried out, the questionnaires were edited to check if all the relevant questions have been responded to and coded according to the codes designed for the study. Editing and coding started in July 2007 and finished in February 2008. Data entry was carried out under the supervision of one programmer/supervisor. Consistency checks on the data set as per the computer edit specifications designed by the subject matter specialists were performed.

2.6 Survey Management and Coordination

National AIDS Coordination Agency (NACA) coordinated BAIS III survey activities while Central Statistics Office (CSO) implemented it. Several committees were established and operated during the survey as a strategy to involve stakeholders.

CHAPTER 3: DRIED BLOOD SPOTS (DBS) LABORATORY TESTING

3.1. *Testing:*

1. BAIS III Project was carried under Good Clinical Laboratory Practice (GCLP) at Botswana National Health Laboratory (NHL). All laboratory testing personnel for BAIS III were required to be knowledgeable of the testing procedures. New employees were trained and assessed for competence before they could handle participant samples. Documentation of training on the procedure was placed in Personnel Files.
2. Upon reception at the Sample Reception of the NHL, samples and forms were examined for acceptance. The acceptable spots were those uniformly soaked on paper on both sides of the paper and were free from contamination and clots. The prerequisite was also that the participant identification (PID) number on the form should match the PID on the sample.
3. Dried blood spots (DBS) were rejected and not tested if: (a) contaminated or hemolyzed specimens; (b) showed presence of blood clots or clumps; (c) had circles not properly saturated with blood; (d) deemed to be of poor quality; and (e) PID on form not matching PID on requisition form.
4. In BAIS III (unlike in general surveys), DBS specimens were screened for HIV antibodies in a parallel testing algorithm using commercial ELISA test kits - Vironostika-HIV Uni-Form II plus O (Organon Teknika, Boxtel, The Netherlands) and Murex (Abbott, Wiesbaden, Germany) as per Botswana National Policy on HIV Testing.
5. Any specimen that was reactive on parallel ELISA testing was considered HIV antibody positive, and was diagnostic for HIV infection, whereas any specimen that was not reactive on parallel ELISA testing was HIV antibody negative. Any specimen that showed discordant results (one test being positive and the other being negative) was retested to exclude clerical or technical errors. If discordance continued, HIV DNA PCR was used to resolve it.
6. All HIV-1-positive specimens were retested with the Aware BED enzyme immunoassay (EIA) HIV-1 incidence Test (Calypse Biomedical Corporation, Portland, Oregon, USA) to detect recent HIV-1 seroconversion.
7. Specimens with $ODn \leq 1.2$ on the initial single Aware BED EIA test were tested again in triplicate to confirm their ODn values. In confirmatory testing, if the ODn of the specimen is ≤ 0.8 , the specimen was considered recent infection with sero-conversion having occurred within the previous 155 days (95% CI 146-165 days) based on multiple sero-converter studies (Package insert - Aware BED enzyme immunoassay (EIA) HIV-1 incidence Test). Otherwise, the specimens were classified as long-term infection.
8. Finally the laboratory test results were passed to the Central Statistics Office (CSO) – Botswana National Statistical Agency responsible for BAIS III data collection, processing, analysis and dissemination of results.

3.2 *Derivation of Prevalence and Incidence:*

1. The derivation of incidence and prevalence measures for BAIS III was a collaborative effort between CSO and NHL. HIV incidence was calculated as the number of recent sero-conversions divided by the population at risk (those testing HIV-negative plus those recently sero-converting) then annualized by multiplying by 365 divided by the estimated length of mean sero-conversion duration for the BED-CEIA

(or 155 days; 95% CI 146 – 165 days). Accordingly annual HIV-1 incidence was calculated using the following consensus formula:

$$I = \frac{(365/w) N_{inc}}{N_{neg} + (365/w) N_{inc}/2} \times 100$$

Where;
 w = window period,
 N_{inc}= number recent HIV infection,
 N_{neg}=number HIV sero-negative

2. In the absence of locally determined window period and following some extensive discussions, it was decided that 155 days will be used as the window period. These discussions were carried with knowledge that window period can vary due to the following: HIV subtype and population. The table below provides some guidance.

Subtype	Country	Window (95% CI)
AD	Kenya	171 (150-199)
B	Amsterdam	127 (113-152)
B	Thailand	143 (118-170)
C	Zimbabwe	181 (165-198)
C	Ethiopia	167 (154-180)
E	Thailand	115 (106-125)
OVERALL		155 (146-165)

The 95% confidence interval (CI) for the Incidence estimate is:

$$95\% \text{ CI} = I \pm 1.96 \frac{I}{(\text{SQRT of } N_{inc})}$$

Where I = incidence, and SQRT of N_{inc} = square root of number of recent HIV infections.

3. Furthermore, during the discussions, we in the laboratory highlighted that using the above equation to calculate incidence will produce an overestimate of the incidence due to the following reasons:
 - a. Individuals on ARV therapy
 - b. Individuals with elevated IgG possibly due to co-infections
 - c. Individuals with AIDS
 - d. Individuals with long term infection who happen to be misclassified by the test.
4. During BAIS III all but a few individual (missing specimens – includes finished specimens) who tested positive were screened with Aware BED enzyme immunoassay (EIA) HIV-1 incidence Test. Following this, there clear long term infections. Specimens with ODn ≤ 1.2 on the initial single Aware BED EIA test were tested again in triplicate to confirm their ODn values. However, a few specimens from individuals who had indicated that were on treatment, were at this stage excluded from further testing.
5. It is worth noting that when calculating incidence, we were well aware that the calculations will give us an unadjusted incidence figure. It is also worth noting that we are well aware that the Surveillance and Survey Working Group and Laboratory Working Group to the Office of the Global AIDS Coordinator (OGAC) recommends adjustment of incidence and currently there are two adjustment formulas to achieve this correction for the BED-CEIA.
6. These are;
 - a. McDougal Adjustment for Sensitivity/Specificity Adjustment:

$$\text{Correction Factor } F = \frac{(R/P) + \gamma - 1}{(R/P)(\alpha - \beta + 2\gamma - 1)}$$

$$I = \frac{(F)(365/w) R}{N + (F)(365/w)(R/2)} \times 100$$

where F = Adjustment Factor for sensitivity/specificity adjustment,

I= Incidence,

R = total testing recent on the BED-CEIA,

P=total testing HIV positive,

N=total testing HIV negative,

α = sensitivity of BED-CEIA test for detecting recent ($< w$) infection,

β = specificity of the BED test over the period $> w$ to $< 2w$, γ = specificity of the BED-CEIA test over the period $> 2w$,

w = window period in days

b. Hargrove Adjustment for Specificity

$$I = \frac{R - \varepsilon P}{(R/2) + N(w/365) - \varepsilon N - \varepsilon(P/2)} \times 100$$

Where

I=incidence,

R=total testing recent on the BED-CEIA,

P=total testing HIV positive,

N=total testing HIV negative,

w=window period in days,

ε = false recent rate in those with long term ($> 2w$) infection

7. According to expert opinion, these adjustment factors are optimal in populations where no or few HIV infected individuals are currently on antiretroviral therapy (ART). In populations where there is wide use of ART, the BED-CEIA may misclassify persons on ART as recent infections. Therefore, when testing samples with the BED-CEIA, persons on ART should be identified and excluded from analysis. In the event that this is not possible, the probabilities of ART use in the sample and expected misclassification of persons on ART as recent infection can be inferred.
8. The results for incidence were subjected to expert reviews before being exported to CSO. Be that as it may, these results are still subject to adjustment that may be deemed constructive and necessary.

In conclusion it is important to recall that in any national survey and data management systems such as that of BAIS III, there is room for some random errors that may apply to both fieldwork and data management processes. However, these random errors do not, especially at the national level, significantly bias results in well managed data systems/processes. There is sufficient statistical evidence that data collection and management in Botswana that provide direct estimates and have been developed over the years are of very high quality. Accordingly, caution has to be taken while employing indirect techniques for adjustments of estimates that the original 'directly' derived estimates are not discarded based on assumptions. This is principally because these techniques are always based on assumptions that do not necessarily hold true for all populations in all conditions. Accordingly, the direct estimates should always be kept in view. In this regard, as far as BAIS III is concerned, the initial estimates of prevalence, incidence and all socio-economic, household, behavioural and demographic, health and other HIV/AIDS measures directly derived from BAIS III will always keep their position until another scientifically collected data that will provide direct comparable

measures. In this regard, measurement of incidence (a new comer in this process) through future comparative data collection in Botswana has a solid comparative base in BAIS III results.

CHAPTER 4: DATA PROCESSING AND MANAGEMENT, ANALYSIS AND RESULTS

4.1 *Data Processing and Management*

After field editing and correction in the field, the questionnaires were sent to the CSO while the DBS specimens were sent for HIV testing to the laboratory.

4.1.1 *Data Coding, Editing and Entry*

The processing of Household and Individual schedule data which included coding, editing and data entry was carried out at the CSO while DBS returns were administered at the NHL and partly described above. The questionnaires were manually edited to check for accuracy of responses and to ensure that codes assigned to the responses were in agreement with the designed codes.

The design and installation of data entry, coding and editing program preceded the fieldwork. The structure of the questionnaire was developed to accommodate the use of the SPSS, SAS, or STATA statistical packages for ease of data entry. Data entry utilized an intelligent data entry program that controls data ranges and skip patterns, and includes limited consistency checking. Trained data entry clerks were engaged in the data entry process. Data editing included the checking of range, structure and internal consistency. Once all the data cleaning was complete, all tabulations needed for the preliminary and final reports were produced and reviewed. The production of tables was based on tabulation plans.

With respect to the strict adherence to the confidentiality of blood specimens, after data entry and cleaning have ended, the DBS collection form, which includes the unique barcode assigned to the individual's HIV blood sample, was removed from the questionnaire and destroyed. This is to ensure the anonymity of the HIV test results. The unique barcode will serve as the means for merging the survey and test results data files.

4.1.2 *Weighting of the Sample*

Once the data set was cleaned, sampling weights were applied to the data. Being a multistage design, it follows naturally that the sample selected at each stage represents (or is assumed to) the respective population. The fundamental assumption is that units selected at each stage were similar to those not selected, in respect of characteristics of interest. In the treatment of unit for the non-response the assumption that the responders were similar to non-respondents though should not be always taken for granted.

Sampling weights are equal to the inverse of the probability of selection. Therefore the sampling probabilities at first stage of selection of EAs including probabilities of selecting the households were used to calculate the design weights. Non response adjustments were also taken into considerations while calculating the final sampling weight.

4.1.3 *Data Analysis Plan*

A detailed data analysis plan was developed following the completion of the final questionnaire. The plan indicates clearly a simple description of the analysis related task to be performed after all the data has been collected from the field and processed. Such a task involves specialized activities such as designing and presenting cross-tabulations; calculating HIV prevalence and incidence point estimates and confidence intervals of the studied population. The plan also establishes guidelines and timeframes within which the analysis is to be carried out, bearing in mind the need for accuracy, confidentiality, and data ownership.

4.2 Analysis and Dissemination of Results

4.2.1 Data Analysis and Reports

The BAIS III Technical Working Group (TWG) identified stakeholders who would participate in the analysis; preferably competent subject specialists who would be engaged to work directly with and under the guidance of CSO and the NACA. After the dissemination of the preliminary results in the form of Stats Brief, two BAIS III reports were expected to follow, namely: a Final Statistical Report and an Analytical/Policy Report which includes information on both the knowledge and behavioral data obtained in the survey and on the HIV testing results. It was envisaged that a brief workshop between TWG and Reference Group (RG) would be held to review the draft of each report. Members of both TWG and RG were tasked to make substantive/technical comments on the report within a given timeframe before further processing, printing and publication. CSO and NACA have the responsible to undertake the final formatting of the reports with copies provided to all the parties to BAIS III agreement.

4.2.2 Dissemination and Utilization of Results

NACA and CSO play a key role in facilitating the dissemination of results to policy makers, stakeholders, and other program planners and designers. Two primary approaches are used to disseminate the results. First, dissemination seminars are held involving as many stakeholders as possible. These includes policy makers, technocrats, program developers and service administrators drawn from civil society, government, non-government agencies and international partners that are involved in the fight against AIDS in Botswana. The purpose is twofold: (i) to announce the availability of the data aimed at increasing awareness of new information emanating from the survey; and (ii) to stimulate reflection on how the information can be used to inform various development policies and implementation strategies.

Second approach is the dissemination of the results through the publication and launch of report documents, conference and independent research papers and journal articles. The objective being to assure the greatest utilization of the survey results as well as the widest dissemination of information to those involved in fighting the AIDS epidemic both nationally and internationally.

4.2.3 Distribution of the Survey Datasets and User's obligations

Upon completion and publication of the final statistical report, the BAIS III data file was made public. Accordingly, the anonymous dataset may be released to other responsible scientific organizations or individuals for statistical analysis on request from Government Statistician.

All researchers who make use of the data are expected copies of their analyses to CSO.

4.3 The BAIS III Statistical Report

4.3.1 The content of the statistical tables.

The Statistical Report is made up of statistical tables drawn from all the sections of household, individual and DBS data files representing different sections of the questionnaires. Accordingly, the statistical tables published here, (chapters 5 to 12 below) are made up of the following sections:

- i. Socio-demographic and household conditions;
- ii. The scale of the pandemic – HIV prevalence and incidence;
- iii. Sexual history and behavior;
- iv. Male circumcision and Sexually Transmitted Infections (STIs);
- v. Knowledge about HIV & AIDS and level of access to intervention;
- vi. Attituded toward PLWHA, Gender issues and Counseling

- vii. Childbearing and Antenatal Care; and
- viii. Availability of Social and Medical Services.

These tables represent a very small fraction of the vast array of statistical tables that can be produced from BAIS III data. The report does not in any way purport to fulfill the diverse interests of consumers or users of BAIS III data and/or results. It may however serve as an effective stimulant for users to dig deeper into the data files. Since the report uses data from all the sections of the data files it assures users that, generally, the BAIS III data is of good quality.

4.3.2 The statistics in the tables

4.3.2.1 Relative versus absolute numbers

The statistical tables in most cases are presented in relative numbers (percentages). Wholly absolute number tables are used where it is deemed essential or more meaningful to assess the magnitude of particular condition(s) in that manner. In a number of cases it was found feasible and thought more meaningful and useful to present the tables in a mix of relative and absolute numbers. In this first generation of tables, emphasis on relative numbers has been placed on a “within-category” of a population type in a given condition number rather than on “across-category”. Age specific prevalence and incidence rates are typical examples – but in the same manner, we also have “sex, district, residence, educational attainment/level, marital status, religious affiliation and occupation specific rates. Accordingly, most of the relative numbers are specific rates of a given HIV and AIDS related conditions; this is largely because HIV & AIDS dynamics is better understood within given conditions of specific population categories or characteristics.

4.3.2.2 Numerators and Denominators

Significant effort has been made to make the title of each table as explicit as possible to clearly define the implied numerator(s) and denominator(s). The heading of each column in every table has been well spelt out to indicate whether it is an enumerator or denominator column. Where relative numbers have been derived in all cases denominator column has been left in absolute numbers. This is partly to facilitate working backward to obtain the absolute size of numerators if users so wish, particularly in situation where they may not easily be in a position to obtain or have access to the original data files when such a need arises. In general, the tables have been constructed in such a way that makes them easy to read and comprehend by the general readership of HIV and AIDS information. Users are advised to contact CSO if they need clarification with respect to issues arising in the process of trying to read and understand the tables.

CHAPTER 5: EXTRACTS OF BAIS III RESULTS

5.1 *Socio-demographic, household and housing conditios*

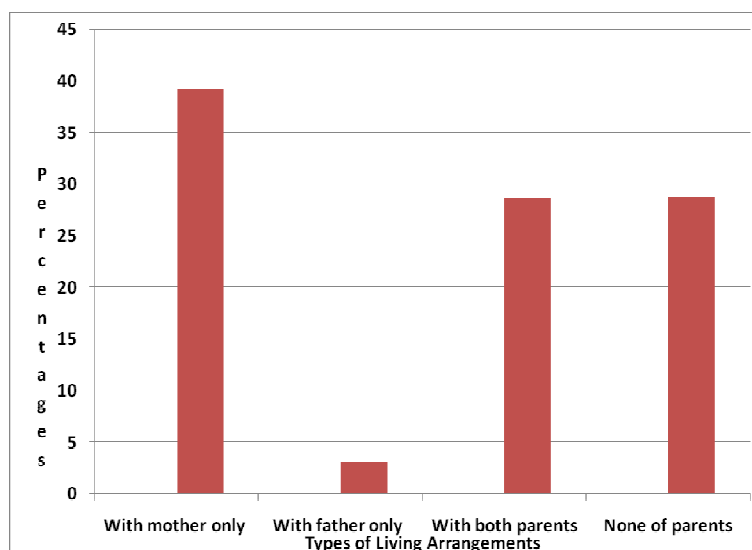

5.1.1 *Demographic characteristics*

The survey estimated the population of Botswana at 1,802,958. There were in total 852,231 males and 950,727 females giving a sex ratio of 90 males per 100 females. In relative terms females comprise of 52.7 percent of the population compared to 47.3 percent males. This is also observed for urban and rural populations where there are more females than males. Botswana's population is estimated to be 55.2 and 44.8 percent urban and rural respectively. Nearly a quarter of the population is found in Gaborone and Kweneng East that contain 11.1 and 13.1 percent respectively. 34.2 percent is below age 15, while 6.0 percent is 65 years and older.

BAIS III reveals that young adults (15-29 year-olds) are predominantly found in urban areas. Infants and primary school-going children (1-14year-olds) are found predominantly in rural areas, coinciding with more people aged 50 years and above residing in rural areas.

The majority of households are found in urban areas versus rural areas; 57.1 percent and 42.9 percent respectively. About 81.3 percent of the households had at most 5 household members. Almost all of the households (96.3 percent) had at least one member between the ages of 10 – 64 years, while 52.3 percent of the households had at least one child under the age of 18 years; 28 and 49.8 percent of the households had a child under the age of 5 and 15 years respectively. Among the population aged 12-64 years, 57.7 percent are never married while 15.7 percent are married. Similarly these proportions were also observed when comparing the rural to urban. More than 20 percent of this population (21.9 percent) reported living together, with similar proportions observed when stratifying by urban and rural residence status. Only 1.1 percent of this population reported being divorced. Figure 1 below shows the distribution of children by type of living arrangement. While about 39 percent children live with their mother, only 3 percent live with their fathers

Figure 1: PERCENTAGE DISTRIBUTION OF CHILDREN BY TYPE OF LIVING ARRANGEMENT

5.1.2 *Socio-economic: Education*

Table 8 shows that 79.4 percent of people in urban areas attained higher education, 28 percent of them in Gaborone alone, while 20.6 percent are in rural areas. Of all the people who have never attended school 68.4 percent reside in the rural areas. The same is true when this data is further disaggregated by districts.

Generally, most of the respondents seem to be educated across all age groups with 81.3 percent of age group 10-14 years having primary education, 83.2 percent of age group 15-19 years with secondary education and 24.3 percent of age group 25-29 years have tertiary education. However 10 percent of all people across all age groups who participated in the survey never attended school that corresponds to the 9.8 percent that cannot read at all.

It is interesting to note that among the children aged 12-17 years whose current education status was obtained, the non-orphaned children have only a slight advantage over the orphaned children. While 89.2 percent of non-orphaned children were in school, 85.9 percent of the orphaned children were also in school.

5.1.3 Socio-Economic: Economic Activity

The survey results show that general economic participation rate is 55.7 percent, with urban areas posting 59.8 percent compared to rural's 50.0 percent. It is also worth noting that the results also reveal that there are a lot more economically inactive people in urban areas (52 percent) than in rural places (48 percent). A large proportion of the economically inactive (students, housework and the sick) are found in Kweneng East (14 percent), Central Serowe (9.6 percent) and Gaborone (9.5 percent).

5.1.3.1 Employment status - Unemployment

BAIS III estimated the overall unemployment rate at 26.2 percent with females most hard hit (31.2 percent) relative to their male counterparts (21.9 percent). Unemployment is higher (39 percent) for females residing in rural areas as compared to the 27 percent for those in urban areas. When disaggregated by age group and gender unemployment stands high for females aged 20-49 years at 28.6 percent whereas for males of the same age group is 20.3 percent. Among the districts, at 48.2 percent of the economically active population, Barolong has the highest unemployment rate. Unemployment is also highest among the youth. The males aged 20-24 years have 36.0 percent unemployment rate while their female counterparts have 54.9 per cent

5.1.3.2 Employment Status – Currently employed

It was found that most (65.5 percent) of the currently employed population is urban and only 34.5 percent rural. Gaborone (18.1 percent) and Kweneng East (13.8 percent) make up 31.9 percent of all the currently employed in the country. Evidence from the data also shows that there are more males (56.3 percent) employed than their female counterparts (43.7 percent). When those employed are disaggregated according to age groups, those falling within 25-29 years are mostly employed (19.3 percent) than the rest of the groups; followed by those who fall within the 30-34 age group at 17.3 percent.

5.1.3.3 Currently employed - Occupation

Most of the employed population (24.6 percent) indicated that their main occupation was elementary occupation followed by service workers and shop assistants at 16.4 percent. The same pattern is being observed for both males and females. The data further reveals that those who were either legislators or administrators or managers made the least proportion (5.3 percent) of the currently employed. Occupation categorization by sex reveals that 56.3 percent of the employed population was males while females accounted for 43.7 percent. Females were dominant in occupations like Clerks (74.3 percent), Technicians and other Associate professionals (55.9 percent) and Service Workers, Shop Market Sales workers (52.5 per cen). Makes were more dominant in majority of the occupations, in particular, Plant and Machiner (93.1 percent), Craft and related Trade Workers (76.2 percent) and Skilled Agricultural Workers (64.7 percent).

5.1.3.4 Currently employed - Industry

Employment by Industry shows that all persons employed in Fishing are males (100 percent -). Relative to females, males are also dominant in Construction (86.4 percent), Electricity, Gas and Water Supply (83.8 percent); and Mining & Quarrying (77.6 percent). Females were found to dominate service related industries such as Private Households (77.2 percent), Hotels and Restaurants (71.0 percent), Financial Intermediaries

(64.0 percent) and Education (63.8 percent). These patterns have been observed in other surveys like Labour Force Survey and, Demographic Survey.

5.1.4 Household Members' Characteristics

5.1.4.1 Households with continuously ill persons

Table 39 shows household members who were bedridden for at least 3 months in the past 12 months by age group. A total of 29,321 persons were reported to have been bedridden for at least 3 months. The analysis shows a large proportion (22.7 percent) of bedridden persons is in the 30-39 years age bracket. Nearly 50 percent of the bedridden persons are concentrated in the reproductive age group of 25-49 years.

Urban areas, rural areas and urban villages have the highest numbers of households having children living with bedridden parents or guardians compared to cities and towns each having 49.8 percent, 50.2 percent and 36.2 percent of children living in households with bedridden parents or guardian respectively. In Central-Serowe, about 15 percent of households are having children living with continuously ill parents followed by Central-Mahalapye at 13 percent. It also shows that in districts like Orapa, Lobatse, Sowa, North-East and Chobe there are no households that have children living with bedridden or continuously ill parents or guardians.

5.1.4.2 Assistance given to continuously ill people

The results revealed that 64.7 percent of all bedridden persons received care and assistance which came either from hospitals, relatives, community organizations, traditional healers, e.t.c. It also shows that more than 85 percent of bedridden persons aged between 5 and 19 years received care and assistance. More than half of bedridden persons aged 20-59 years received care and assistance, but it's also notable that less than 50 percent of the elderly bedridden persons were given care and assistance. Furthermore, about 75 percent of households having children living with bedridden parents or guardians did not receive help or support. The results indicate that 84 percent of the bedridden persons received free medicine, 33 percent received counseling and 22.9 percent received extra food. In response to the question of satisfaction with the given assistance/care, 37.1 percent reported to be very satisfied while 30 percent said they are not satisfied.

5.1.4.3 Deaths in the households

The number of deaths in the past 12 months preceding the BAIS III survey was 20,254. Nearly half of these (9,902) occurred in the reproductive age group 15-49. About 47 percent of reported deaths were of people aged 20-49 years. It was also found that 9,318 of those who died were not sick for more than 2 months; 26 percent of those who died were sick for less than a month. Reportedly AIDS accounted for 20.8 percent of the deaths, 25.2 and 16.2 percent in the urban and rural areas respectively. Male deaths made up 57.1 per cent.

5.1.4.4 Children's living arrangement

BAIS III found an estimated 724,082 children aged 0-17 years. Only 28.7 percent lived with both mother and father; 39.3 lived with mother only; 3.2 percent lived with father only; children who lived with non of their parents constituted 28.8 percent. When children were categorized by age, it was found that higher percentage (45.2 percent) of children aged 0-4 years are more likely to stay with their mothers compared to older children aged 5-9 years (39.4 percent), 10-14 years (36.2 percent and 15-17 years (32.9 percent). This finding suggest that the probability of a child staying with the mother decreases as the child grows older.

5.1.4.5 Children's orphanhood status

There was an estimated combined single and double orphans of 111,567 making 16.2 percent of all children aged 0-17 years. Children who have lost both parents (double orphans) numbered 21,990 and made up 3.0 percent of all children; children who lost only their father constituted the majority of the orphans – 67,653 out of 111,567. According to the results of the survey, as children grow in age they are more likely to be orphaned; only 6.7 percent of children 0-4 were found orphaned compared to 28.9 percent among those aged 15-17 years. Nearly 40 percent of all orphans live with their grandparents.

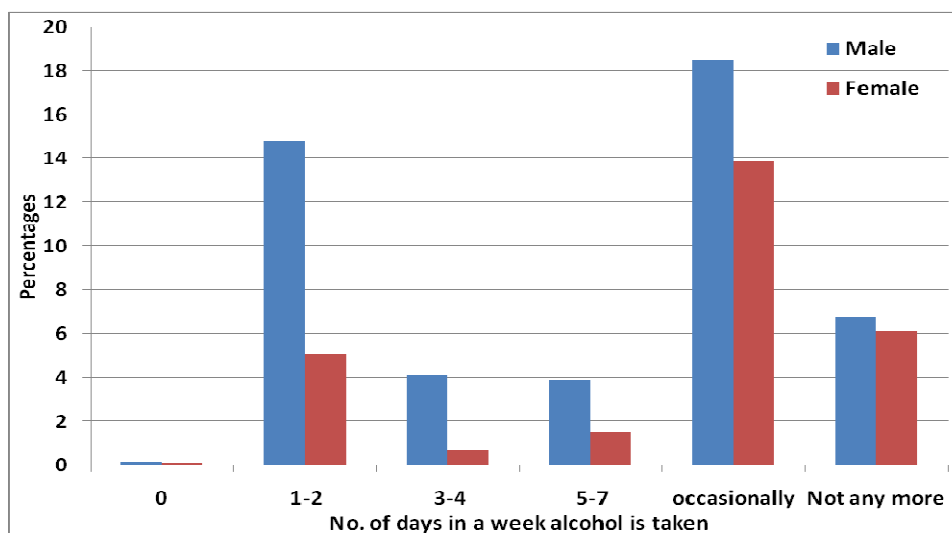

The orphans live in an estimated total of 71,119 households in the country. Only 20,511 of these households reported receiving outside help in support of the orphans. Reportedly, 30,587 orphans received outside help. It should be noted that in addition to the orphans there were an estimated 12,303 other vulnerable children. These are children who were found to have lived in a household with parents/guardians who were continuously ill for at least three months during the 12 months preceding the survey.

5.1.5 Alcohol and Drug Use

5.1.5.1 Alcohol

Nationally, it was found that out of the 1,028,444 respondents, 37.4 percent of them stated that they had ever consciously taken alcohol drink. In Orapa, however, 51.9 percent had taken alcohol before, followed by Gaborone at 48.0 percent and in third place is Jwaneng with 47.6 percent. The lowest proportion was recorded in Chobe with 26.0 percent. Among the males aged 10-64 years, just under half (48.9 percent) of them had ever taken alcohol, whereas for females it is only 27.7 percent. According to figure 2 below, frequency of alcohol consumption is quite different for males and females. Out of all males aged 10-64, 14.8 percent of them take alcohol 1-2 days in a week, while the comparable percentage for females is 5.1 percent. The highest proportions of male and female respondents who take alcohol occasionally are 18.5 percent and 13.9 percent respectively.

Figure 2: Percentage distribution of persons 10-64 years old by no. of days in a week alcohol taken

It was found that the majority (52.1 percent) of people who are Living Together, stated that they had ever consciously taken alcoholic drink, followed by those who are Separated with 41.7 percent. With respect to education 51.9 of those with higher education have even taken alcohol, closely followed by those who never

attended school (51.5 per cent). It is also worth noting that majority (62.7 percent) have been intoxicated at least once in the 4 weeks preceding the survey.

5.1.5.2 Drug use

With respect to drugs, just about 3 percent of the respondents reported taking drugs for recreation; 5.7 percent among males and only 0.5 percent among females. The highest proportions of national population that have ever taken drugs are found in Gaborone (17.0 percent) and Kweneng East (10.3 percent). Those who take drugs are most likely never married, educated up to secondary school level (Figure 3) and aged 20-39 years (Figure 4). With respect to occupational groups, those who take drugs are concentrated in three categories namely: elementary occupation, craft and related trade workers, and service workers and shop and market sales workers. As shown in Figure 5 below, Motokwane is the commonest drug, taken by 89 percent of the respondents who have ever taken drugs; 27.7 percent of those who take drugs do so on a daily basis; 62.9 percent of drug users are urban residents.

Figure 3: Percentage distribution of persons 10-64 years old ever taken drugs by educational attainment

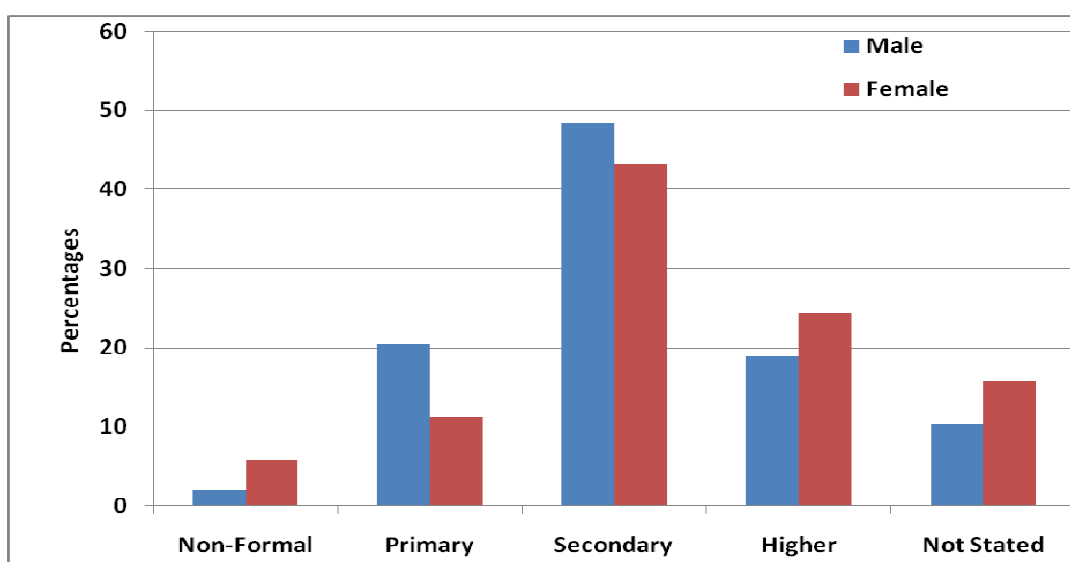

Figure 4: Percentage distribution of persons 10-64 years old ever taken drugs by age group

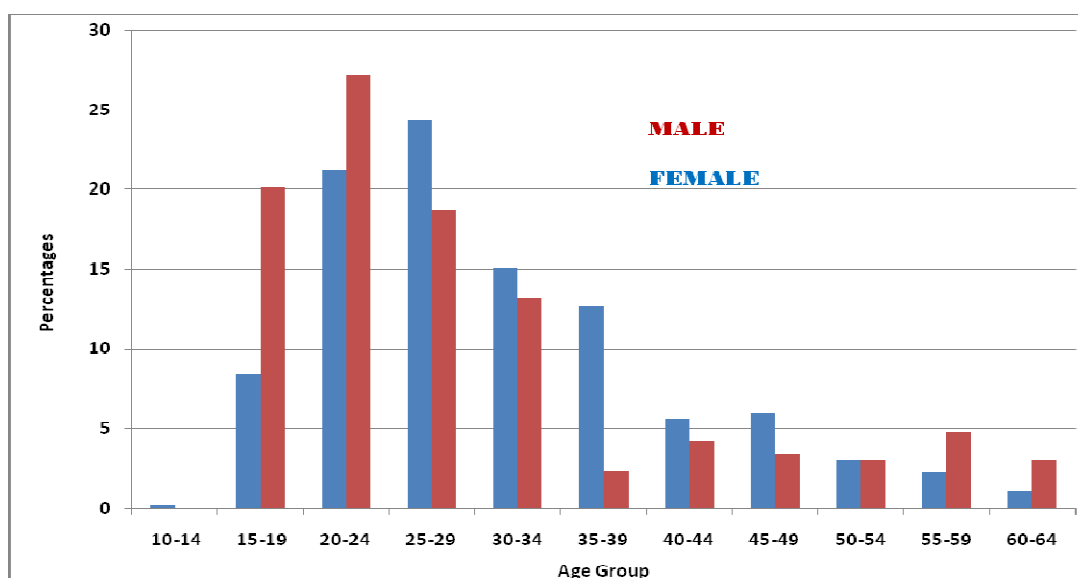

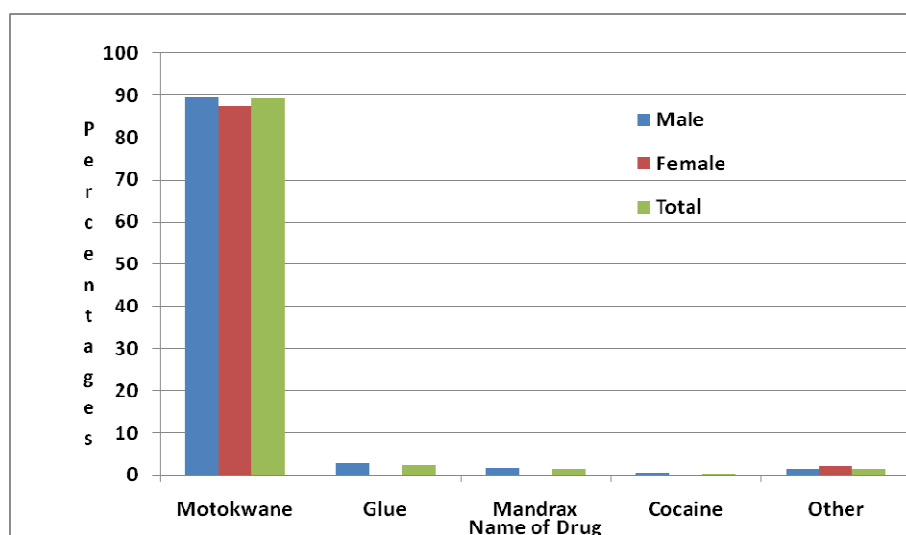

Figure 5: Percentage distribution of persons 10-64 years old ever taken drugs and type of drugs

5.2. The Scale of the Pandemic: HIV Prevalence and Incidence

The BAIS III survey estimated a national prevalence rate of 17.6% compared to 17.1% in the BAIS II survey of 2004. The new HIV infection rate was estimated at 2.9%.

5.2.1 Sex

Females have a relatively higher prevalence rate of 20.4% and males 14.2%. There was an overall increase in HIV prevalence for both males and females from 2004 BAIS II to 2008 BAIS III. HIV Incidence rates follow a similar trend by sex, that is, they are higher in females (3.5%) than in males (2.3%). The sex differentials in prevalence and incidence rates can also be observed at district levels in figures 6 and 7 below (mapping the prevalence and incidence).

5.2.2 Age

HIV prevalence by age group ranged from 2.2% in the 1.5 to 4 year age group to 40.6% in the 40 to 44 year age group. HIV prevalence increases sharply with age peaking between the ages of 30 to 45 years and gradually declines with an increase in age. In the 2004 BAIS II survey this peak was seen in the earlier age groups of 25 to 39 years, and has since shifted to the 30 to 45 year age group in 2008. This is the age group with highest rate of new HIV infections with the 45 to 49 year age group having the highest incidence rate of 7.3% and the lowest being in the 15 to 19 year age group with an incidence rate of 0.7%.

5.2.3 Residence

The estimated 17.9percent HIV prevalence rate in urban areas collectively is slightly higher than the rural rate of 17.1percent. However, when Towns are singled out they have a much higher HIV prevalence rate (22.1percent) than the other urban areas – cities 19.1 and urban villages 16.6 percent. Similarly, urban population has higher incidence rate (3.4percent) compared to 2.3percent in rural population.

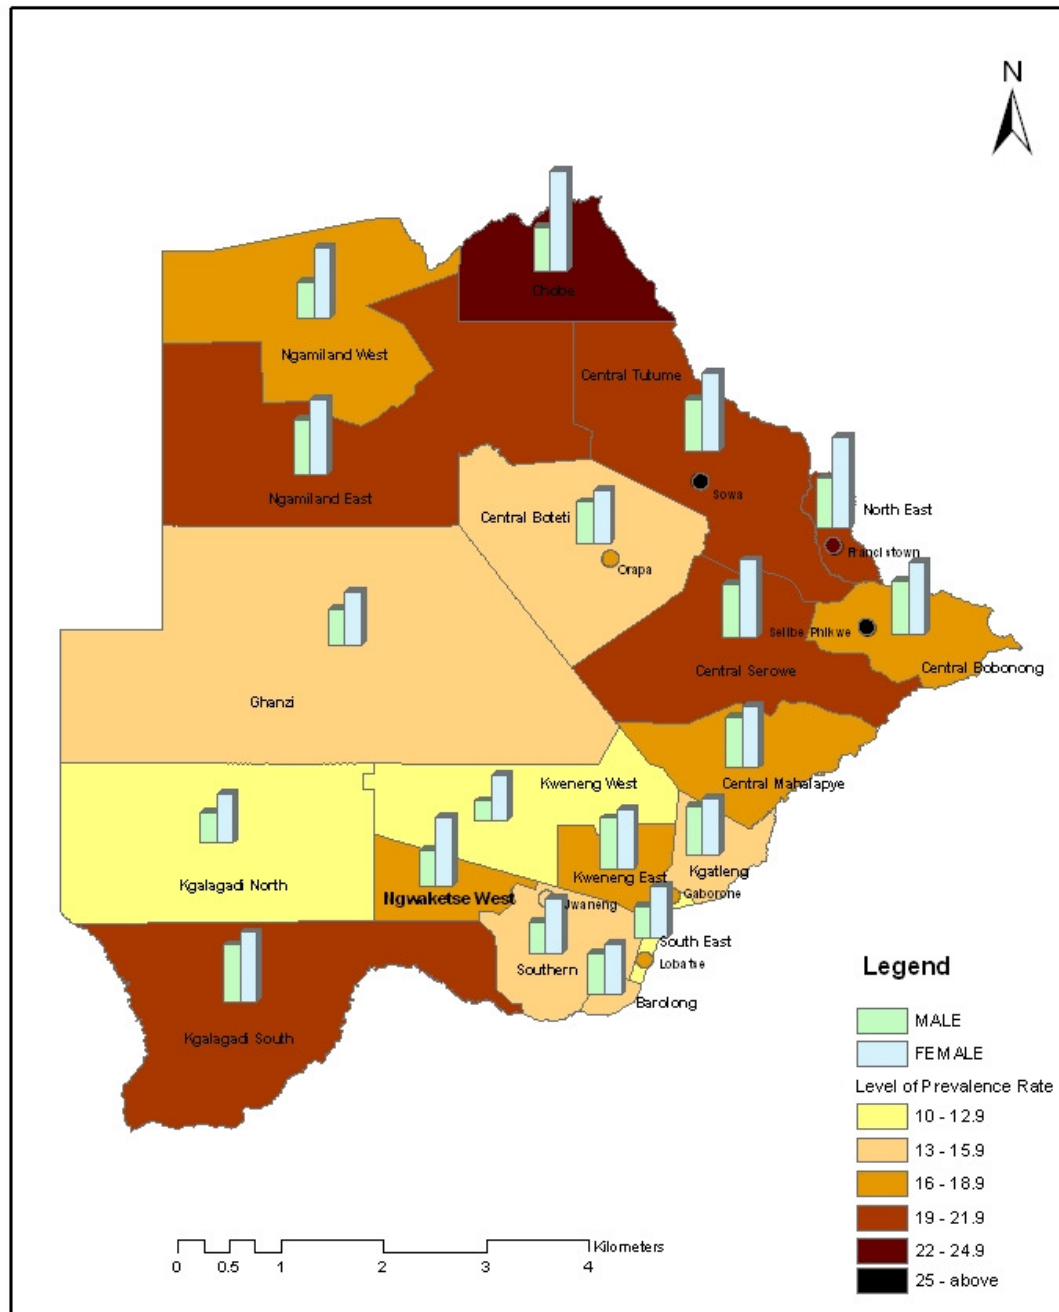

5.2.4 *District*

HIV prevalence by district ranges from 10.3% in Kweneng West to as high as 26.5% in Selebi-Phikwe. Fig 1 below shows an attempt at mapping the prevalence at the district level to show the national pattern of the pandemic. Districts with relatively high prevalence rates are Selebi-Phikwe, Francistown, Sowa and Chobe, while Kweneng West, Kgalagadi North and South East have lower rates. Figure 7 is a map of incidence rates. In some districts, HIV incidence rates appear not to be consistent with prevalence rates. For instance, Kweneng West remains low in terms of HIV prevalence but has a relatively high HIV incidence rate of 3.5%. The district pattern of HIV incidence rate shows that, Central-Bobonong, Ngamiland East, Selebi-Phikwe, Francistown and Central Serowe (all above 4 per cent) could be described as being in the 'high' incidence zone, relative to the national estimate of 2.9 per cent. It is noted that the sampling procedure did not pick up any recent HIV infection in Sowa and Ghanzi – not implying that there are no new infections in those districts/towns. The lowest incidence rates, below 1 per cent, were the estimates for Central Mahalapye (0.9%) and Chobe (1.0%). Of all the districts Central Bobonong recorded the highest incidence rate of 5.6 percent.

The age-specific HIV prevalence rate constructed for each district reveals that the infection is heavily located in the reproductive population aged 30-44 with the exception of the mining towns or Orapa and Jwaneng. The national age specific rate peaks at around 40 percent in this age range. Very high HIV prevalence rate is recorded in Central Serowe (60.1 percent) at age 40-44; Central Bobonong (63.8 percent) at age 35-39; Central Tutume (60.1 percent) at age 40-44; Ngamiland North, (67.2 percent) at age 30-34; and Chobe (61.7percent) at age 35-39. In some of these districts the female prevalence rate goes as high as over 70 percent

Fig. 7: Map – District Pattern of HIV Incidence:

ESTIMATED HIV INCIDENCE RATES AMONG BOTSWANA POPULATION AGED 18 MONTHS AND ABOVE BY DISTRICT AND GENDER

Source: Botswana AIDS Impact Survey III, December 2008.

5.3 Sexual History and Behaviour

5.3.1 Sexual history and behavior in the general adult population aged 10-64 years

Of the 746,160 respondents who ever had sexual intercourse 53 percent had first sexual intercourse when aged 15-19 years; by age 24 years 85.6 percent of them had had first sexual intercourse. More of the females (59 percent) relative to males (44 percent) had their first sexual intercourse at age 15-19 years. With regard to the use of condom, 54.3, 55.2 and 36.7 percent of those who had sexual debut at age 15-19, 20-24 and 25+ years respectively reported condom use. The younger the current age the more likely the respondent used a condom during sexual debut. For example 91 percent of those who are currently aged 15-19 used a condom during their sexual debut at the same age; 89 percent of those who are currently aged 20-24 years used a condom during their sexual debut at age 15-19 years, the corresponding percentage for the current 25-29 year-olds is 76 percent. That is, the older a person is, the less likely that s/he used a condom during sexual debut earlier on in age. Those who had sexual debut at an older age are also less likely to use a condom during that encounter. Educational attainment is positively associated with the use of condom during sexual debut – the higher the education, the higher the proportion of those who would have used a condom during sexual debut although there is evidence of a slight drop among those at higher level of education relatively to those at secondary school. A much lower proportion of those who are currently married used a condom in their sexual debut relative to the never married and those living together regardless of what age that sexual debut took place. These observations generally apply to males and females as well.

5.3.2 Sexual history and behavior in the reproductive age-group 15-49 years

All those who ever had sexual intercourse were asked about the use of condom with their most recent, next-most recent and second-most recent sexual partners during the past 12 months. Generally about 55 percent of the respondents used a condom the first time they had sexual intercourse with their most recent sexual partners. However the use of condom tends to decline during sexual intercourse with the next-most and second-most recent partners. About 50 percent used a condom during their last sexual intercourse with the most recent partner while only 43.6 percent reported using condom always with the same most-recent partner. Generally in all these sexual intercourse scenarios, condom use with the next-most recent and the second-most sexual partners is much lower.

In an attempt to establish the extent of multiple concurrent partnerships (MCP) respondents were asked about number of people they had had sexual intercourse during the last 12 months and the last one month. Among the males who had sexual intercourse during those time periods, 77 percent reported having sexual intercourse with one partner, while the rest, 23 percent, had more than one partner. The corresponding percentages for females are 89.6 and 10.4 respectively. During the last one month however, 91.4 percent of males reported having sexual intercourse with one partner and 9.6 percent with more than one. A much higher proportion of females, 97 percent, reported sexual intercourse with one partner and only 3 percent had it with more than one partner.

With respect to the use of condoms with regular and non-regular sexual partners during the past 12 months 27.7 percent reported using condoms always in regular sexual partnership; 39.6 percent said they always used a condom in non-regular relationships. While 45.8 percent of males reportedly used condoms in a non-regular relationship, 34.6 percent of females did.

Among all who were drunk the last time they had sexual intercourse within last 12 months with their most-recent partner about 63 percent reported that they used a condom. The corresponding proportions for males and females are 66 and 60 percent respectively.

5.4 Male Circumcision and Sexually Transmitted Infections (STIs)

5.4.1 Male circumcision

Among the males aged 10-64 years old, 11.8 percent reported being circumcised. Circumcision has an apparent rise with age. It is lowest among the 10-14 year-olds with 4.1 percent and highest among the 55-59 year-olds with 20.8 percent. While less than one percent of the men in Kweneng West are circumcised, 27.7 and 34.2 of the men in Sowa and Orapa respectively are circumcised. About 16 percent of the men in Cities and Towns are circumcised compared to 8.8 percent in the rural areas.

5.4.2 Sexually Transmitted Infections

For most of the respondents who said they have ever heard of STIs ‘offensive discharge from vagina’ (38.9 percent) and ‘genital ulcers and/or open sores’ (44.2 percent) would lead them to think that a woman has an STI. The corresponding proportions for male respondents are 30 and 38 percent respectively, while for females they are 46.3 and 49.5 percent respectively. Similar signs in a man, that is, ‘discharge from penis’ and ‘genital ulcers and/or open sores’, would lead 34.3 and 43.8 percent respectively to think that a man has an STI. The corresponding proportions among both male and female respondents are just about the same. Nearly all respondents (96 percent) point out that people can go for STIs treatment at the clinic or hospital which, for 85.5 percent of the respondents, also serves as a source of advice on STIs. While 2.4 percent of the male respondents who reported having sexual intercourse during the past 12 months indicated they had genital discharge, 7.5 percent of females did. With respect to genital ulcers and/or open sores, 2.4 and 2.8 percent of males and females respectively had it.

5.5 Knowledge about HIV & AIDS and Level of Access to Interventions

Condom use and having ‘no sex at all’ are two major ways identified by respondents for the prevention of HIV infection. Most respondents (85 percent) who have ever heard of the virus HIV or an illness called AIDS identify condom use, while 54.8 percent also identify ‘no sex at all’ a preventive measure against HIV infection. The corresponding response rates for males and females do not vary significantly from these.

Most of the people in Botswana who have heard of the virus HIV or an illness called AIDS know the major misconceptions about HIV transmission. A high proportion (84.5 percent) of them point out that a healthy looking person can have HIV; 81 percent indicate HIV cannot be transmitted through witchcraft while 59.3 percent indicate that transmission of HIV cannot occur through mosquito bites. In addition, 75.6 percent of the respondents indicated that a person cannot get infected with HIV & AIDS by sharing a meal with another person who has HIV & AIDS. When asked about mosquito bites and witchcraft as medium of HIV infection only 51.8 percent of the respondents rejected both misconceptions; correspondingly 47.5 and 52.8 percents of males and females respectively.

Most of the respondents also correctly point out that HIV & AIDS can be transmitted from a mother to a child (MTCT) either during pregnancy (86 percent) or during delivery (78 percent) or through breastfeeding (94.5 percent). However the proportion of the respondents who correctly point out all the three ways of transmission drops to 66.5 percent, while those who know at least one of the ways of MTCT is 98.9 percent.

Among those who say there are ways of prevention of HIV transmission from a mother to an unborn child (PMTCT), 89.6 percent identify ARV as a means of prevention. With respect to those who say there are ways to the prevention of transmission from mother to a newborn child, 79 percent identify ‘no breastfeeding’ a means of prevention, while 20 percent still point out ‘AZT drugs before birth’ as another means to prevention. These proportions did change much when denominator was filtered to include only those who say there are ways to prevent HIV transmission from mother to both unborn and newborn child.

The respondents who reported they were aware about ARVs were asked whether they believe that ARVs cure AIDS. Among the males and females 22.6 and 24.4 percent respectively believe that ARVs cure AIDS. It was also found that 92.7 percent of these respondents think that people on ARVs should always use condoms.

5.6. Attitudes Toward PLWHA, Gender Issues and Counseling

5.6.1 Attitude toward PLWHA

Most of the respondents (94.9 percent) who have ever heard of the virus HIV or an illness called AIDS said they are willing to care for a family member sick with HIV & AIDS; 82.7 percent would allow a teacher with HIV&AIDS to continue teaching; 76.3 percent would buy vegetables from a shopkeeper or food seller with HIV & AIDS; and 60 percent would not keep a family with HIV & AIDS a secret. However, only 41 percent of the respondents expressed all accepting toward PLWHA.

5.6.2 Gender issues

The 10-64 year-olds were asked to express their perception about a woman’s right to decide if she will have safe sex (such as by using a condom). Overall 68.9 percent agreed, while 65.6 and 71.7 percent of males and females respectively agreed. With respect to a woman protecting herself from getting a sexually transmitted infection from an infected partner, 85.1 percent of the respondents said she can (83.6 of males and 86.3 percent of females). As far as what a woman can do to protect herself from such a source of infection, most of the respondents (92.4 percent) said she can insist on condom use and there was very little difference between male and female response to this. Only 17.3 percent said she can protect herself by refusing sexual intercourse.

5.6.3 Voluntary counseling and testing

Of the 1,031,677 people aged 10-64 years, 581,555 (or 56.4 percent) reported to have ever been tested for HIV. Among those who have ever been tested 62.0 percent had been tested in the past 12 months; 56.6 percent were given information on HIV & AIDS before the test; 60.5 percent were told results of the test; 55.2 received counseling when given the results of the test; and 54.0 percent told someone the results of the test.

When attention was focused on the 972,673 who have ever heard of the virus HIV or an illness called AIDS, it was found that 59.8 percent of them have ever been tested; 51.2 percent of the males have ever been tested compared to 66.9 percent of the females; 62.2 percent reported being tested in the past 12 months. Among those who had been tested in the past 12 months 91.4 percent were given information before testing; 97.2 percent were told the results; 91.2 percent received results with counseling; and 94.5 percent indicated that they would want to be tested again.

Figure 8: Prevention

Indicators	2001	2004	2008
Percentage of women and men aged 10-64 who have ever received an HIV test	15.2	27.9	56.4
Percentage of women aged 10-64 who have ever received an HIV test		30.3	63.4
Percentage of men aged 10-64 who have ever received an HIV test		19.5	48.0
Percentage of women and men aged 15-49 who received an HIV test in the last 12 months and who know their results	9.4	18.3	41.2

5.7 *Childbearing and Antenatal Care*

There was an estimated 561,999 women aged 10-64 years; while 61.5 said they have ever given birth, 60.9 percent of them reported to have had a live birth. Among those who have ever given birth, 25.3 percent gave birth once, 39.8 percent gave birth 2-3 times, and 34.9 percent gave birth 4 or more times. Similarly among those who had a live birth 26.7 gave a live birth once, 40.7 percent gave a live birth 2-3 times and, 32.6 percent had a live 4 or more times.

Among the women aged 15-49 years, there were found an estimated 68,813 women who gave birth during the past 24 months. When disaggregated by marital status, 28,450 were never married; 27,455 living together; and 11,814 were married; the rest, 1092, were either separated, divorced, or widowed. The women reported a 93.7 percent antenatal care attendance rate; 91.7 in the rural areas compared to 95.3 percent in the urban areas. The women aged 45-49 posted a little lower ANC attendance rate of 87.8 percent, but they were very minimal in number – only 166 of them. Relative to all other districts the lowest ANC attendance rate was reported among the women in Ghanzi and Kgalagadi North both with 82.0 percent.

Among all the women aged 10-64, there were found 87,604 women who attended ANC during their last pregnancy. Among those who gave response to inquiry about information on HIV/STI, 86.5 percent said they were given information about HIV/STI during visit(s) to ANC; 92.6 percent of those who responded to inquiry on HIV test offer said they were offered the test; 94.7 percent agreed to be tested for HIV. It is worth noting that only 73.4, 75.5 and 76.3 percent of the women in South East, Central Boteti and Lobatse were given information about HIV/STI during their visit(s) to ANC in their last pregnancy; figures are well below the national average of 86.5 noted above.

5.8 *Availability of Social and Medical Services*

The respondents aged 10-64 were asked about their awareness about availability of various social and medical services. The following levels of awareness were found among them:

Type of social and medical service		Level of awareness among the 10-64 year-olds (in percentage)
1	Home based care	53.2
2	Orphan care	55.7
3	Support for PLWHA	32.2
4	Destitute programmes	56.9
5	ARV programme	48.8
6	PMTCT programme	49.8
7	IPT programme	36.2
8	VCT/RHT programme	49.2

It is worth noting that the level of awareness about ARV, PMTCT, IPT and VCT/RHT programmes seem to be positively associated with level of educational attainment (see table below). The level of awareness on these programmes also tends to be lower among the rural population relative to those urbanites.

Type of social and medical service		Level of awareness among the 10-64 year-olds (in percentage) by educational attainment	
		Never attended	Higher level
1	ARV programme	33.9	63.3
2	PMTCT programme	29.3	66.4
3	IPT programme	23.5	47.3
4	VCT/RHT programme	33.7	60.5

An estimated total of 341,416 were reported to have ever accessed social and medical services; 79.3 percent of them said they received HIV & AIDS prevention message(s) through these services; 56.9 percent of them specified that they received HIV & AIDS prevention message(s) through VCT/RHT; only 14.1 and 11.0 percent received such message through ARV and PMTCT programmes respectively.

5.9 *Conclusion*

The details of the gist of the results tables outlined above can be found in the tables that follow. It is advisable that the tables are read in consultation with the household and individual questionnaires from which they originate so that appropriate meaning and context can be readily derived.

APPENDIX B: SURVEY METHODOLOGY

B.1 Survey Methodology

The 2008 Botswana AIDS Impact Survey III (BAIS III) was designed to provide a comparison (trend) between HIV prevalence rate, behavior, knowledge, attitude, and other factors that are associated with the epidemic with estimates derived from previous surveys i.e. 2004 BAIS II.

B.1.1 Target population for 2008 BAIS-III

The target population focused at two levels:

- i. For the biomarker segment of the survey, the population covered aged 18 months and above;
- ii. The behavioural segment targeted all usual members of the selected households aged 10 to 64 years.

B.1.2 Scope and Coverage

Only private dwellings were within the scope of the survey. Institutional dwellings (prisons, hospitals, army barracks, hotels, etc) and places with completely industrial area were not within the scope of the survey.

The non-citizen tourists who were in Botswana on holiday and not working here were also not included in the survey. Foreign tourists may, of course, be here as visitors to a selected household for the survey. In such cases they were treated as visitors, their names were recorded and the relevant questions were asked about them only at household level.

BAIS III was a nation-wide study using administrative district and sub-districts that are used by the Central Statistics Office.

B.1.3 Sampling Frame

The Sampling frame was defined and constituted by all *Enumeration Areas (EAs)*¹ found in three geographical regions viz. (i) Cities & Towns (ii) Urban Villages², and (iii) Rural Districts as defined by the 2001 Population and Housing Census. The sampling frame for BAIS II & III consisted of 4,114 EAs. During the 2001 Census, EAs were framed of manageable size (in terms of dwellings/households), so the primary sampling units (PSUs) were EAs. A list of occupied households in the selected EA served as sampling frame for that EA so the secondary sampling units (SSUs) were occupied households. Being a two-stage design, two frames were

¹ **Enumeration Area [EA]** : An Enumeration Area (EA) is the smallest geographic unit, which represented an average work-load for an enumerator over a specified period (census period)

² **Urban Villages**: These are villages each with a 2001 Census population of 5,000 or more and at least 75 percent of its workforce engaged in non-subsistence agricultural economic activities. There are 27 urban villages distributed over the districts.

required one for each stage. The sampling frame for the first stage was based on the 2001 Population and Housing Census. The sampling frame for the second stage was produced only from the selected EAs by listing of all private habitable dwellings/households in their EAs. Thus the number of occupied households in the selected EA served as a sampling frame for that EA.

B.1.4 Stratification

The merits of stratification include:

- Administrative convenience and flexibility
- Guaranteed representation of important domains and special sub-populations, and
- Increased precision of survey estimates.

Stratification was undertaken such that all districts and major urban centres become their own strata. With regard to increase precision consideration was also given to group EAs according to the five major ecological zones (i) village, (ii) lands; (iii) cattle post (iv) freehold farms (v) mixture of land and cattle post in rural districts and according to income categories (i) high, (ii) medium, (iii) low, (iv) self help housing agency (SHHA); and (v) industrial in cities/towns. Geographical stratification along ecological zones and income categories was expected to improve the accuracy of survey data in view that homogeneity of the variables is relatively high. Strata 1-7 comprised of cities and towns; stratum 8 was a derived stratum of EAs of Urban Villages of rural districts (strata 9-27).

Apart from national, urban and rural estimates, the Government, which is the main user of CSO data, requires accurate estimates for all districts/sub-districts for planning and monitoring of development projects. Stratification would therefore be undertaken such that all districts and major urban centers become their own strata. With regard to increasing precision, consideration was also given to group EAs according to income categories in cities/towns and according to ecological zones in rural districts (implicit stratification). Geographical stratification along ecological zones and income categories was expected to improve the accuracy of survey data in such a way that homogeneity of the variables is relatively high.

There are five major rural ecological zones, namely:

- Village,
- Lands
- Cattle Post
- Freehold Farms
- Mixture of Land and Cattle Post

During the delineation of maps, each EA was associated with unique ecological zone and thus, grouping EAs into respective zones was not a problem. To facilitate the selection according to the stratification variables, EAs were listed in some order, for example; starting with cattle post, then farms etc. in case of rural areas.

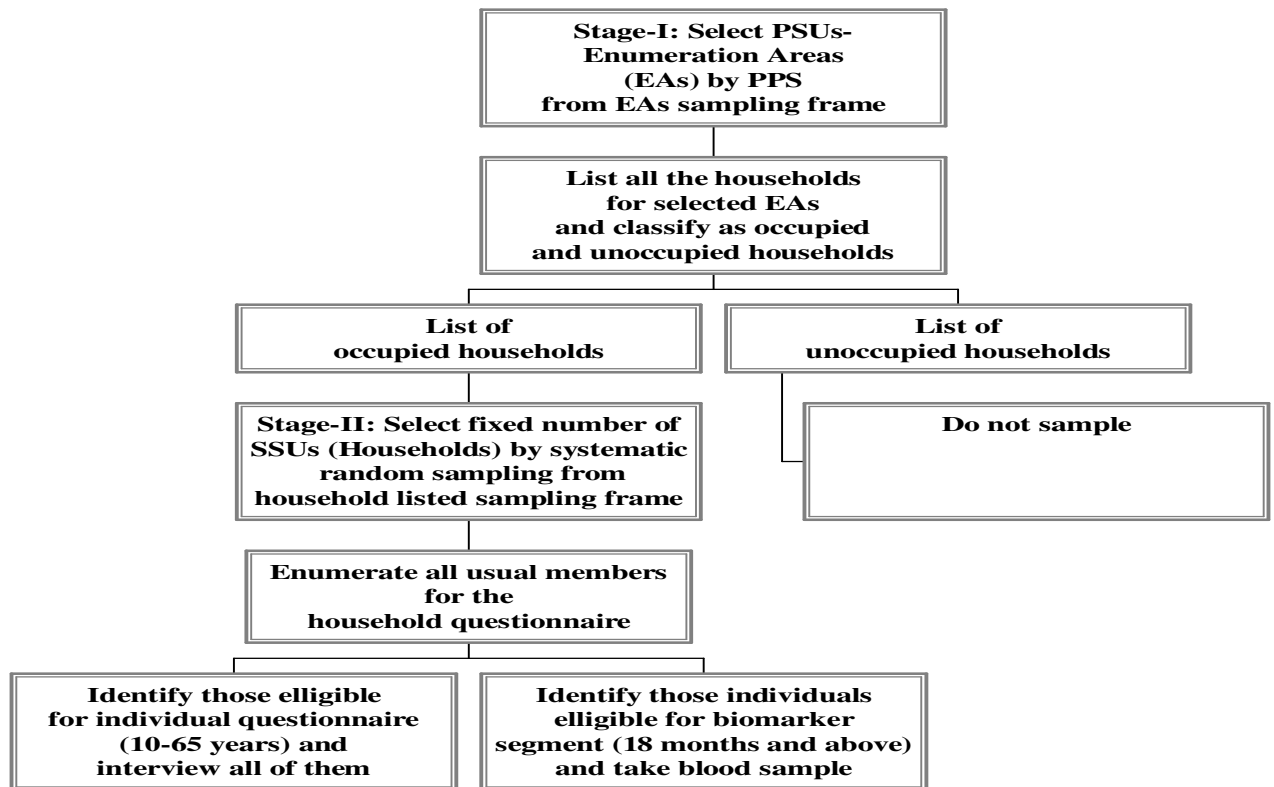

B.1.5 Sample Design

A stratified two-stage probability sample design was used for the selection of the BAIS III sample.

The first stage was the selection of Enumeration Areas (EA) as primary sampling units (PSU) selected with probability proportional to measures of size (PPS), where measures of size (mos) were the number of households in the EA as defined by the 2001 Population and Housing Census. In all 459 EAs were selected with probability proportional to size. At the second stage of sampling, the households were systematically selected from fresh list of occupied households prepared at the beginning of the survey's fieldwork (i.e. listing of households for the selected EAs). Overall 8,275 households were drawn systematically.

***Remark:** To estimate changes in BAIS III indicators as compared to BAIS II, it was planned to revisit all those enumeration areas which were selected in BAIS II. However the selection of households in these EAs was new. The revisit of the same EAs increased the correlation between the observations to some extent; consequently the precision of estimated changes are high.*

STEPS IN DRAWING A SAMPLE

B.1.6 Sample size and Allocation of Sample (Households) to Strata

The size of the sample is perhaps the most important parameter of the sample design, because it affects the precision, the cost and duration of the survey more than any other factor. Some of the key points should be born in mind when devising the procedure for sample size.

First, the procedure is intended for survey whose one of the objectives is also to measure changes in selected behavioral indicators over time. Secondly, sample size requirements are addressed with respect to indicators measured as proportions. This is the type of indicators commonly used in behavioral survey for HIV.

With the consideration of statistical determinants (margin of error, design effect, household size etc.), the overall sample size for 2008 BAIS-III was 8,275 households.

Remarks: Two general rules of thumb govern the choice on numbers of PSUs (EAs) and SSUs (households): (i) the more PSUs, it is better, as both geographic representation, or spread, and overall reliability will be improved; and (ii) the smaller the number of SSUs, the more reliable estimates will be.

For BAIS-III the sample (households) was allocated to strata proportionally to the total number of household as per 2001 Census. There were 15 households sampled

per EAs selected in Cities, Towns and Urban villages, while 25 households were sampled in each selected rural EA.

Table1: Distribution of Households and EAs: 2008 BAIS III

	Place of Residence				Total
	Cities	Towns	Urban Villages	Rural	
Enumeration Areas in Sample,	109	45	166	139	459
Households in Sample	1,635	675	2,490	3,475	8,275

Remark: Complete rural district results will need the estimation of any urban small town or urban village component to add to the rural component.

Table 2. Distribution of Households and Persons Enumerated by Residence and Response Rates

Households and Persons Enumerated		Residence by Response Rates					
		Urban				Rural	Total
		Cities	Towns	Urban	All		
Enumeration Areas in Sample		109	45	166	320	139	459
Number of Households	Sampled	1,635	675	2,490	4,800	3,475	8,275
	Completed	1,431	590	2,180	4,201	3,029	7,230
	Response rate	88%	88%	88%	88%	87%	87%
Persons Enumerated		4084	1682	8322	14088	10874	24962
Persons aged 10-64 years eligible for individual questionnaire	Total Eligible	3,331	1,305	5,898	10,534	6,884	17,418
	Completed	2,688	1,099	4,769	8,556	5,669	14,225
	Response Rate	81%	84%	81%	81%	82%	82%
Persons aged 18 months and above eligible for HIV Testing	Total Eligible	3,534	1,477	7,167	2,178	9,236	21,414
	Provided Blood Specimen for HIV	2,184	979	4,682	7,845	6,506	14,351
	HIV Testing Participation Rate	62%	66%	65%	64%	70%	67%

B.2 Questionnaires

The BAIS III questionnaires were developed from the 2004 questionnaires so as to provide the basis for current (where feasible) and future comparability. This was arranged so as to assist Botswana obtain trends in national and international (UNGASS, UNAIDS, etc) core monitoring and evaluation (M& E) indicators that will be used to be obtain national and international indicators. For those HIV/AIDS indicators relevant to Botswana but have not yet been introduced into national-level surveys, some new questions were added and/or adapted from other surveys in order to be able to obtain those indicators that are not yet available. During the questionnaire development process, input was sought from the TWG as well as other development partners/organizations that are expected to use the resulting data. The Stakeholders were requested to make their data needs known and those interested did send their requests in writing to TWG for review and follow up.

After the BAIS III questionnaires had been developed/drafted, the CSO in collaboration with NACA organized a workshop to review the draft questionnaires with a wide range of potential users, including government health agencies, non-

governmental health organizations, interested donor groups, and faith-based service groups.

The final versions of the draft questionnaires were pre-tested prior to implementation of the main survey. From the household questionnaire, all the usual members of the households aged 18 months and above were eligible for the Biomarker. They were requested to provide a finger stick blood sample on filter paper for subsequent HIV testing in the laboratory.

Two questionnaires were administered for the 2008 BAIS III survey, namely (i) Household Questionnaire, and (ii) Individual Questionnaires. In the 2004 BAIS II four questions were administered namely; Household Questionnaire, Individual Questionnaire, Community schedule and workplace schedule. For BAIS III the Community schedule and workplace schedule were dropped to ensure that the survey remains focused. Special surveys will be conducted for them in collaboration with relevant partners.

B.2.1 The Household questionnaire

Household questionnaire was divided into **five** major sets of questions, namely:

- i. Parental survival and fostering
- ii. Type of economic activity, Occupation and Industry
- iii. Household characteristics such as type of housing unit, material used for construction of housing unit, water supply source of energy etc.
- iv. Health, care and support for household members
- v. Eligibility Criteria for being an individual questionnaire respondent

B.2.2 The Individual questionnaire

The Individual questionnaire was divided into **eight** major sets of questions, namely:

- i. Background characteristics (age, education, occupation, religion, etc.)
- ii. Alcohol consumption and drug use
- iii. Sexual History and Behaviour
- iv. Male circumcision and Sexually Transmitted Diseases
- v. Knowledge about AIDS and Level of Exposure to Interventions
- vi. Attitudes Towards People Living with HIV/AIDS, Gender Issues and Counseling
- vii. Childbearing and Antenatal Care
- viii. Availability of social and medical services

In addition to the questionnaires, other technical documents that were produced included:

- Enumerator's Training and HIV Testing Manual;
- Interviewer and Supervisor Assignment Sheets;
- HIV Testing Consent Forms

CSO provided prototype of the Interviewers Training Manual, Questionnaires and Interviewer Supervisor Assignment Sheets while National Health Laboratory provided prototype of the HIV Testing Manual and HIV Testing Consent Forms.

B.2.3 Publication of questionnaires

It is a requirement that the BAIS III questionnaires and topics covered be published in the national Gazette according to Statistics Act, Chapter 17:01 before field operation. Therefore the questionnaires were submitted for publication immediately after the approval of the questionnaires by the Reference Group.

B.3 Publicity for Public Awareness

A special BAIS III publicity team was established to develop a convincing strategy and ensure its implementation. All existing structures such as Parliament, Councils, Kgotla, newspapers, electronic media, DMSAC were used to prepare the communities and to brief them on the utility and benefits of the survey.

Several methods were used to make the population aware of the Survey: These included:

- 1) Botswana Television (BTV) and Radio Botswana (RB) played a major role. Presentations, Call in programs were conducted on RB. BTV interviews on the survey were carried out and screened.
- 2) Press releases in the form of advertisements were produced in the various local newspapers.
- 3) Posters/brochures, bags and vehicle stickers were given to individuals for publicity.

2.4 General Approach to Field Data Collection

The proposal to carry out the BAIS III was approved by the Health Research Development Committee (HRDC) and thus adhering to international ethical standards.

B.4.1 Informed Consent Procedures

Consent for BAIS III was requested for all the BAIS III components, household, individual questionnaires; blood specimen for HIV testing. Verbal consent was sought for entering a household and the subsequent administration of the household and individual questionnaires. The interviewer introduced him/herself to the household head or other appropriate adult respondent and explains the nature of the research and its benefits to the community and the country. The interviewer only proceeded with the research undertaking once he or she is confident that the participant has fully consented to be interviewed.

As the survey included children and minors (under 18 years of age), parental or guardian consent was sought on their behalf. For those minors that qualify for the behavioural questionnaire, questions that do not affect them are skipped, as per the

design of the questionnaire. For each of the components of the consent, the interviewer signed the questionnaire to indicate that he/she read the consent statements to the participant.

As noted earlier, this survey included the collection of a blood sample. In accordance with internationally agreed upon standards, such as the International Ethical Guidelines for Biomedical Research Involving Human Subjects, investigators are expected to ensure that study participants have given voluntary and informed consent to provide specimen for HIV testing. Taking a blood sample requires that the participant gives a further verbal informed consent (see appendix 3 & 4 for adult and child consent respectively). The interviewer would have explained the nature of the biomarker collection, its potential risks to the participant and the potential benefits of such data collection for the country. Such explanation includes the detailed description of how samples will be collected, labeled, stored and analyzed. The respondents are assured of the anonymity of the HIV test results. Participants are also assured utmost confidentiality in accordance with provisions made under the laws of Botswana.

B.4.2 Confidentiality

Interviewers and laboratory technicians were trained to ensure privacy during the administration of the survey questionnaires and the consent to the testing component. A high level of confidentiality and anonymity was also strictly adhered to in handling the data from the survey. The testing of the blood specimens were processed at a different location from the questionnaire data. The test results and questionnaire data were matched only after the bar code was linked to personal identifiers on the questionnaire.

B.4.3 Physical risk related to the collection of blood sample(s)

Taking a finger stick blood sample poses extremely minimal physical risk to the subject. Each team member responsible for taking finger stick capillary blood samples used disposable gloves, alcohol swabs, sterile gauze, and retractable, disposable lancets so as to eliminate risk of contamination. As part of the informed consent procedure, all eligible respondents were informed that the supplies that were used are clean and sterile.

While it was the non-medical personnel that conducted the survey interviews as well as taking the blood samples, it is strongly believed that this did not increase the risk for respondents. The survey interviewers were thoroughly trained in the procedures involved in the collection of the Dried Blood Spot (DBS) samples and closely supervised during the data collection by senior personnel who visited the field teams on a regular basis. Experience in the international Demographic and Health Survey (DHS) program indicates that lay personnel can be adequately trained in the procedures for taking the blood samples and procedures for handling and disposing of hazardous waste.

B.5 Data Collection

B.5.1 Pre-Test

A pretest of all aspects of data collection and other aspects of the survey was implemented. For the pretest, Central Statistics Office (CSO) recruited and trained female and male interviewers who were engaged for approximately a month. Their training included the administration of the questionnaires as well as how to collect blood samples for HIV testing. The pretest was done in areas that were not selected for the main survey. CSO and National AIDS Coordinating Agency (NACA) officers involved in the pretest training accompanied the teams to the field during the pre-test. HIV testing and the laboratory processing of the specimens were part of the pretest.

The pretest was essential in that it provided valuable experience for the survey organizers about questionnaire design, training mechanisms, and fieldwork logistics. This experience was used to modify the survey instruments and biomarker logistics as necessary as well as put in place effective strategies for the general management of the BAIS III data collection processes.

B.5.2 Main Survey

For the main survey, 50 teams were needed and each team comprised of one front line supervisor (team leader), at least 4 interviewers/enumerators (who were also trained to collect the blood samples) and two drivers. Depending on the workload and the terrain of some areas, some of the teams were assigned more than four enumerators. However, extra candidates were recruited to allow for some attrition during the training process and fieldwork. All candidates for field staff positions were screened on the basis of, education level, knowledge of official languages, ability to communicate effectively, and ability to work away from home for up to five months.

Candidates for various positions participated in a four-week training program devoted to various aspects of the survey from the 2nd to 27th June 2008. The four week training for field staff candidates included implementation of public relation strategy, a detailed description of the content of the questionnaire, how to fill the questionnaire, and interviewing techniques. Training also consisted of a mix of classroom lectures, mock interviews and practical field interviews.

A special training program conducted by the Ministry of Health was arranged for the field staff that participated in the DBS. The DBS collection training emphasized procedures to be employed in obtaining respondents' voluntary consent to the HIV testing, the techniques to be used in collecting the samples, the procedures for referring respondents needing follow-up care for HIV counseling and testing and the logistics involved in handling and storing the DBS until they are picked up for transport to the laboratory. A detailed review of the procedures followed in transferring samples from the field to the laboratory was included during the training.

Fieldwork activities took a total of four months according to operational fieldwork conditions starting from the 15th of July to 22nd of October 2008. Close

communication was maintained at all times between the CSO/NACA office staff and field personnel during fieldwork.

B.6 Supervision and Quality Assurance

Quality control in the survey was ensured through effective supervision and monitoring of the interviewing teams during fieldwork. The first level of supervision was provided by the team supervisors. The supervisors were responsible for closely monitoring the work of the teams to ensure that all sampled households are visited, all eligible respondents are contacted, and that all questionnaires are edited in the field for accuracy and completeness. They also observed the interviewers taking biomarker sample in order to ensure that all procedures are accurately implemented.

Further, to ensure the good quality fieldwork, senior staff from CSO and NACA regularly visited the field to check on the performance of teams. Periodic review sessions were held with the interviewing teams. These review sessions were designed to identify and correct errors detected in the fieldwork.

B.7 Limitations of the Survey Methodology

BAIS III is a household based survey and this is common for other surveys. Only private dwellings were within the scope of the survey whereas institutional dwellings (prisons, hospitals, army barracks, hotels, etc) as well as the homeless were not covered. These groups of people may have contributed significantly to the survey results. Secondly, the survey design allows for the analysis up to sub-district level and other major sub-populations such as age, sex and hence sample size may not be adequate for the analysis of small domains.

APPENDIX C: SAMPLING ERRORS- Under Calculation

The estimates from a sample survey are affected by two types of errors: (1) non-sampling error, and (2) sampling errors. Nonsampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the 2008 BAIS III to minimise these type of errors, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in the 2008 BAIS III is only one of many samples that could have been selected from the same population, using the same sample design and expected size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability between all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

The standard error can also be used to compute the design effect (DEFT) for each estimate, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1 indicates that the sample design is as efficient as simple random sample; a value greater than 1 indicates that increase in the sampling error is due to the use of more complex and less statistically efficient design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulae for calculating standard errors. However, the BFHS sample is the results of a stratified two stage design which is considered a complex design, hence special methods and softwares are required to take into account the complexity of the design.

WesVar 4.3 statistical software (supported by WESTAT) was used to obtain standard errors, confidence intervals and design effect for selected indicators. It is a powerful tool for statistical data analysis from complex survey designs which includes multi-stage, stratification and unequal probability samples. Jackknife replication method was applied which forms part of the replication options within this software. To estimate variances using the jackknife method requires forming replications from the full sample by randomly eliminating one sample cluster (enumeration area) from a domain or stratum at a time. Then a pseudo-estimate is formed from the retained EAs, which are re-weighted to compensate for the eliminated unit. Thus, for a particular

stratum containing k clusters, k replicated estimates are formed by eliminating one of these, at a time, and increasing the weight of the remaining $(k - 1)$ clusters by a factor of $k/(k - 1)$. This process is repeated for each cluster.

For a given stratum or domain, the estimate of the variance of a statistic say t (t may be the mean, proportion, ratio e.t.c.) is given by:

$$\text{var}(t) = (se)^2 = \frac{1}{k(k-1)} \sum_{i=1}^k (t_i - t)^2$$

Where:

k is the number of clusters in the stratum or estimation domain,

t is the weighted estimate calculated from the entire sample of clusters in the stratum,

t_i is equal to $kt/(k-1) t_{(i)}$, where

$t_{(i)}$ is the re-weighted estimate calculated from the reduced sample of $k-1$ clusters.

To obtain an estimate of the variance at a higher level, say, at the national level, the process is repeated over all strata, with k redefined to refer to the total number of clusters (as opposed to the number in the stratum).

Sampling errors for selected variables for the country as a whole, are presented below. In addition to the value (R) of type of statistic (mean, proportion), standard error (SE) and value of design effect (DEFT) for each variable, the tables includes the weighted number (WN) of cases on which the statistic is based, the relative standard error (the standard error divided by the value of the statistic) and the 95 percent confidence limits ($R \pm 2SE$). The confidence limits may be interpreted by using the following example: the overall estimate of the proportion of mothers who had tetanus injection 0.8536 and its standard error is 0.0112. To obtain the 95 percent confidence interval, twice the standard error is added to and subtracted from the estimate of proportion of mothers who had tetanus injection, $0.8536 \pm 2* 0.0112$. Thus, there is a 95 percent probability that the true value of proportion of mothers who had tetanus injection lies between 0.8312 and 0.876.

BIAS III HOUSEHOLD QUESTIONNAIRE 2008

BE SURE TO INTRODUCE YOURSELF AND READ ALOUD THE INFORMED CONSENT FORM.

Hello, my name is _____ and I am working with the Central Statistics Office. The Department is working on a project concerned with the HIV/AIDS status of the society. I am here on their behalf to collect such information. This information will ensure that the right programmes are in place to address the HIV/AIDS epidemic in the country. As part of this survey we would first like to ask some questions about your household. We will then go on to the individual questionnaire which is administered to those eligible. Again as part of this survey we also are asking eligible people to provide their blood specimen. All of the answers you give, together with the blood sample will be anonymous and will be very confidential.

Your participation in this survey is voluntary. You can say yes or no to answering any questions or to giving a blood specimen without fear of penalty or any adverse consequences. However, we hope you will participate in the survey since your input will assist the nation in the fight against HIV and AIDS

At this time, do you want to ask me anything about the survey?

May I begin the interview now?

Section 1: Background Characteristics**BE SURE TO INTRODUCE YOURSELF AND READ ALOUD THE INFORMED CONSENT FORM.**

Good Morning/Afternoon, my name is _____ and I am working with the Central Statistics Office (CSO). The Department is working on a project concerned with the HIV/AIDS status of the society. I am here as an enumerator and employee of CSO to collect such information. This information will ensure that the right programs are in place to address the HIV/AIDS epidemic in the country. As part of this survey we would like to ask you some questions about yourself. Again as part of this survey we also are asking eligible people to provide their blood specimen. All of the answers you give, together with the blood sample will be anonymous and kept confidential.

Your participation in this survey is voluntary. You can say yes or no to answering any questions or to giving a blood specimen without fear of penalty or any adverse consequences. However, we hope you will participate in the survey since your input will assist the nation in the fight against HIV and AIDS.

At this time, do you want to ask me anything about the survey?

May I begin the interview now?

Signature of interviewer: _____

First, I would like to ask some questions about you.

No.	Questions and filters	Coding categories	Skip to
Q101	CIRCLE SEX OF THE RESPONDENT	MALE 1 FEMALE..... 2	
Q102	a) How old are you in completed years? b) What is your date of birth? [DD/MM/YY] IF AGE IS LESS THAN 10 OR GREATER THAN 64, END INTERVIEW	AGE IN COMPLETED YEARS..... [][] Day [][] Month [][] Year [][][][]	
Q103	Are you a usual member of this household? Reconcile with P06 in the Household Questionnaire	YES..... 1 NO 2	→ END INTERVIEW
Q104	a) Can you read and understand a letter/newspaper/bible or anything easily, with difficulty or not at all?	EASILY 1 WITH DIFFICULTY 2 NOT AT ALL 3	
Q105	Have you ever attended school, formal or non-formal?	YES..... 1 NO 2	→ Q108
Q106	What is the highest level of school you have attended: non-formal, primary, secondary, or higher?	NON- FORMAL..... 1 PRIMARY..... 2 SECONDARY 3 HIGHER..... 4	
Q107	How many years of education did you complete in total? (Exclude years in pre-school)	YEARS COMPLETED..... [][]	

No.	Questions and filters	Coding categories	Skip to
Q108	How long have you been living in this locality? RECORD 00 IF LESS THAN A YEAR.	YEARS..... [][]	
Q109	a) Are you currently employed/self employed? b) What is your current occupation?	YES..... 1 NO..... 2 SPECIFY _____ CODE [][]	→ Q110
Q110	What is your main religious affiliation?	CHRISTIANITY 1 ISLAM 2 BAHAI 3 HINDUISM 4 BADIMO 5 NO RELIGION 6 OTHER(SPECIFY) _____	→ Q112

	b) Name of drug	NAME OF DRUG_____	
	c) How often do you take drugs?	DAILY 1 WEEKLY 2 MONTHLY 3 OCCASSIONALLY 4 NO LONGER TAKING DRUGS 5	

3. Sexual History and Behaviour

READ OUT:

I am going to ask you some very personal questions about sex. Please bear with us as collecting information on HIV/AIDS issues requires us to ask such sensitive questions. I know it may be difficult to remember exactly, but I would like you to answer the questions to the best of your knowledge, as this information is very important for the survey. Again, this information is all completely private and anonymous and cannot be linked to you or any partner in any way.

No.	Questions and filters	Coding categories	Skip to
Q301	a) Have you ever had a biological child?	YES 1 NO 2	→ Q302
	b) Have you ever had sexual intercourse?	YES 1 NO 2	→ Q401
Q302	At what age did you first have sexual intercourse?	AGE IN YEARS [][] DON'T KNOW 99	
Q303	What were the circumstances under which you first had sex?	WITH CONSENT 1 WITHOUT CONSENT 2	→ Q305
Q304	Why did you consent to have sex at the first time?	MARITAL FULFILLMENT 1 PERSUASION 2 CURIOSITY 3 ECONOMIC REASONS 4 RELATIONSHIP FULFILMENT 5 OLD ENOUGH 6 OTHER (SPECIFY) _____	
Q305	a) Did you use anything to protect yourself?	YES 1 NO 2 DON'T KNOW 3	→ Q306 → Q306
	b) What did you use?	CONDOMS 1 MODERN CONTRACEPTIVES 2 TRADITIONAL METHODS 3 SPRITUAL 4 OTHER (SPECIFY) _____	
	c) Please state the main reason for protecting yourself:	PREGNANCY 1 HIV 2 STI 3 HIV/PREGNANCY 4 OTHER (SPECIFY) _____	

FILTER	CHECK Q305B, Used Condom?	YES 1 NO 2	Q307a
Q306	The first time you had sex was a male/female condom used?	MALE CONDOM..... 1 FEMALE CONDOM 2	
Q307	a) Have you ever had a sexual partner who was ten years older or younger than you?	YES 1 NO 2	Q307c
	b) Would you consider this partner economically worse off or better off than yourself?	BETTER OFF 1 WORSE OFF 2 EQUAL 3 DON'T KNOW..... 9	
	c) Have you ever had sex without your consent?	YES 1 NO 2	Q307f
	d) With whom?	SPOUSE..... 1 FAMILY MEMBER 2 EMPLOYER..... 3 COLLEAGUE..... 4 SUPERVISOR 5 STRANGER..... 6 OTHER (SPECIFY) _____	
	e) When was the last time you had sex without your consent?	DAYS AGO1[][] WEEKS AGO.....2[][] MONTHS AGO3[][] YEARS AGO.....4[][]	
	f) Currently how many sexual partners do you have?	[][]	
	g) When was the <i>last time</i> you had sexual intercourse? ENTER 00 IF LESS THAN A DAY AGO. MORE THAN 12 MONTHS, ENTER "01" AND SKIP TO Q401. Circle and enter code and complete one option Complete only one option	DAYS AGO1[][] WEEKS AGO.....2[][] MONTHS AGO3[][] YEARS AGO.....4[][]	

Now I would like you to think about the last time you had sex, and I am going to ask you some questions about your sexual partners, beginning with the person with whom you had sex most recently. I will begin by asking about your most recent sexual partner, and if there is more than one partner, I will ask only about the three most recent sexual partners you may have had in the past **12 months**. This includes anyone you might have had sex with: husband, wife or wives, girlfriends, boyfriends, friends, casual partners, prostitutes, someone you may have met at a bar, or at a wedding or other special event, etc.

EMPHASIS SHOULD BE MADE HERE THAT THE PARTNERS WE ARE TALKING ABOUT SHOULD BE OF THE PAST 12 MONTHS!

ASK Q308-Q319 , BEGINNING WITH MOST RECENT PARTNER (15- 49 YEARS ONLY).

		Partner 1 Most Recent Sexual Partner	Partner 2 Next Most Recent Sexual Partner	Partner 3 Second Most Recent Sexual Partner
Q308	What is your relationship to [MOST RECENT/NEXT MOST RECENT PARTNER] READ OUT. INSTRUCTIONS ON SAMPLE COLLECTION.

1. Gently squeeze and release the area to be pricked.
2. Put on gloves.
3. Clean the area to be pricked with alcohol swab and then allow to dry for at least 30 seconds.
4. Prick the selected area with the lancet.
5. Wipe away first drop of blood with dry cotton wool.
6. Allow a large drop of blood to collect.
7. Touch the filter paper gently against the large drop and allow to completely fill the circle.
8. Repeat '7' until all five circles are filled with blood.
9. Apply pressure to the pricked area with clean cotton wool until bleeding stops.
10. Place the filter paper filled with blood in the drying box.

INSTRUCTIONS: Please complete one form for each participant.

ADULT'S CONSENT FOR HIV TEST AND STORAGE OF DRIED BLOOD SPOT SAMPLE (18 years and above)																																																							
BLOOD SPECIMEN As I said earlier, for this survey we also are asking eligible people to provide their blood specimen. All of the answers you gave, together with the blood sample will be anonymous and kept confidential. Taking a finger stick blood sample may cause some discomfort with possible bruising and swelling in the area where the sample was drawn. A clot may form at the site of the needle prick, but this usually heals very quickly. However, extreme care will be taken to minimize your discomfort. Disposable gloves, alcohol swabs, sterile gauze, and retractable, disposable lancets will be used. Your participation in this survey is voluntary. You can say yes or no to giving a blood specimen without fear of penalty or any adverse consequences. However, we hope you will participate in the survey since your input will assist the nation in the fight against HIV and AIDS. At this time, do you want to ask me anything about the survey? Do you agree to have blood specimen collected from? YES [] NO [] (If No end interview) Signature of interviewer: _____
