1.0 Preface

Statistics Botswana is mandated to compile data on industrial production in Botswana, hence the Index of Mining Production is confined to minerals extracted across the country. This is intended to monitor the performance of the mining sector in Botswana.

This statistical release presents quarterly Indices of Mining Production (**IMP**) for the period 2013 to the first quarter of 2024. Also included in the report are the annual **IMP** for the period 2013 to 2023, derived as the average of the four quarters of the year. The base year is 2013. Data used in this publication are sourced from the Department of Mines under the Ministry of Minerals and Energy.

The Index of Mining Production stood at **84.9** in the first quarter of 2024 compared to **114.3** registered in the corresponding quarter of 2023, showing a year-on-year decrease of **25.7** percent. On a quarter-on-quarter comparison, the index declined by 16.6 percent from **101.8** recorded during the fourth quarter of 2023.

The release further shows the contribution of each mineral and mineral group to the Year-on-Year Percentage Change in the Volume of Mining Production, and provides the trend in the local mining sector.

For more information, contact the Directorate of Stakeholder Relations on **(+267) 3671300**. All Statistics Botswana outputs/publications are available on the website at www.statsbots.org.bw and at the Statistics Botswana Information Resource Centre.

I sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of Statistics Botswana products and services.

Dr. Lucky Mokgathe
Acting Statistician General
June 2024

2.0 Summary of Findings

All figures in this report are not seasonally adjusted.

Table 1 presents a summary of findings for the Index of Mining Production (**IMP**) from the first quarter of 2013 to the first quarter of 2024. This table forms the basis for the discussions under Sub-Section 2.1. Reference, however, is made to this table and other tables throughout the report.

2.1 Index of Mining Production

The Index of Mining Production stood at **84.9** during the first quarter of 2024 compared to **114.3** registered in the same quarter of the previous year, showing a year-on-year negative growth of **25.7** percent. The main contributor to the decrease in mining production was Diamonds and Copper in Concentrates which contributed negative **23.9** and negative **1.7** percentage points respectively, as shown in **Table 2**. Soda Ash and Salt were the only positive contributors to mining production, at **0.3** and **0.1** of a percentage point respectively.

The quarter-on-quarter analysis shows decrease of **16.6** percent from the index of **101.8** in the fourth quarter of 2023 to **84.9** observed during the period under review.

Table 1: Key Figures in the Volume of Mining Production: 2013 Q1 – 2024 Q1

Base Period : 2013=100			
Period	Index of the physical volume of mining production	Year-on-year percentage change	Quarter-on-Quarter percentage change

Figure 1 : Total Index of Mining Production: 2013 Q1 - 2024 Q1

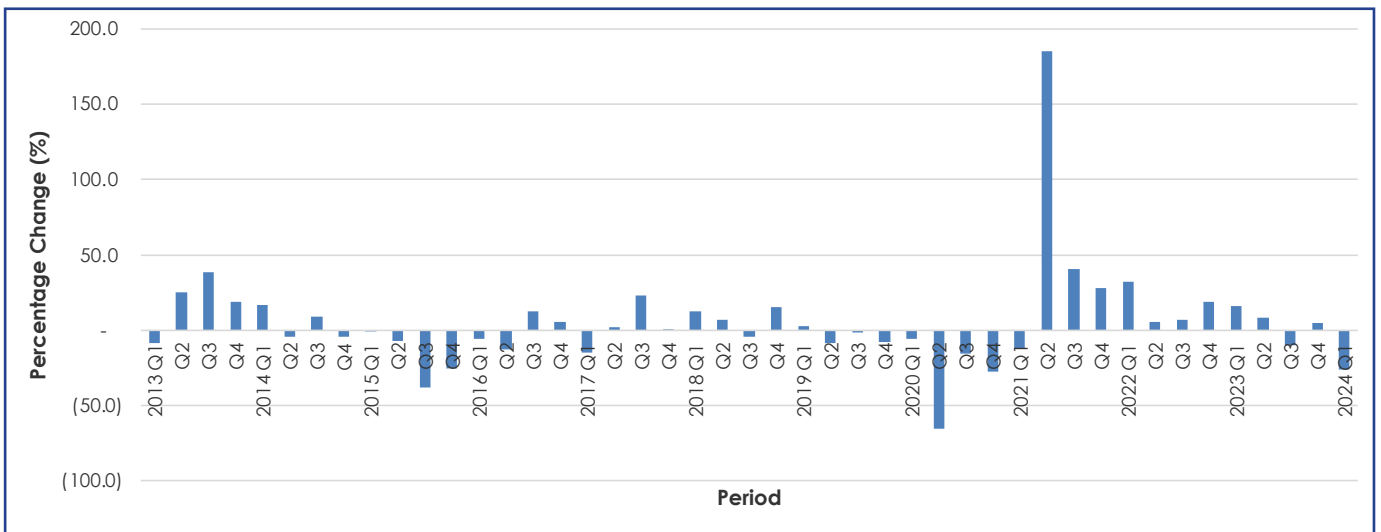

Figure 1 shows the graphical presentation of the Total Index of Mining Production from the first quarter of 2013 to the first quarter of 2024. The linear graph shows that, on average, mining production has been decreasing gradually, between the years 2013 and 2024.

Figure 2: Year-on-Year Percentage Change in Mining Production: 2013 Q1 – 2024 Q1

2.2 Mineral Production

The discussions on mineral production compares production during the first quarter of 2024 to the same quarter of 2023, and are based on Table 2, Table 3 and Table 6. Table 5 provides analysis of the mineral production for the quarter under review, in comparison to the preceding quarter.

Diamond production decreased by 27.4 percent (1,912 thousand carats) from 6,989 thousand carats during the first quarter of 2023 to 5,076 thousand carats during the period under review. Similarly, quarter-on-quarter analysis shows that production decreased by 18.7 percent (1,164 thousand carats) during the first quarter of 2024 from 6,241 thousand carats recorded during the fourth quarter of 2023.

Copper in Concentrates decreased by 16.4 percent (2,439 tonnes) from 14,872 tonnes registered during the first quarter of 2023 to **12, 433 tonnes** during the period under review. Similarly, quarter-on-quarter analysis shows that production declined by 2.6 percent (326 tonnes) during the first quarter of 2024 from 12, 759 tonnes produced during the fourth quarter of 2023.

Gold production decreased by 71.3 percent (50 kilograms), from 70 kilograms extracted during the first quarter of 2023 to **20 kilograms** during the period under review. Similarly, the quarter-on-quarter analysis reflects a decrease of 72.3 percent (52 kilogram) from 72 kilograms during the fourth quarter of 2023 to 20 kilograms registered during the quarter under review.

Soda Ash production increased by 37.4 percent (22,089 tonnes) from 59, 040 tonnes during the first quarter of 2023 to **81, 129 tonnes** produced during the period under review. Similarly, quarter-on-quarter analysis shows that production increased by 1.7 percent (1, 349 tonnes) during the first quarter of 2024, from 79, 780 tonnes registered during the fourth quarter of 2023.

Salt production increased by 17.1 percent (15, 753 tonnes), from 92, 107 tonnes during the first quarter of 2023 to **107, 860 tonnes** during the quarter under review. Similarly, quarter-on-quarter analysis shows that salt production increased by 58.2 percent (39, 674 tonnes) from 68, 186 tonnes registered in the fourth quarter of 2023.

Silver production decreased by 26.3 percent (3,310 kilograms) from 12, 582 kilograms in the first quarter of 2023 to **9, 273 kilograms** in the period under review. The quarter-on-quarter analysis also shows that production decreased by 2.6 percent (244 kilograms) during the first quarter of 2024 from 9, 517 kilograms produced during the fourth quarter of 2023.

Coal production decreased by 19.5 percent (125, 519 tonnes), from 644, 674 tonnes registered during the first quarter of 2023, to **519, 155 tonnes** in the current quarter. On the other hand, quarter-on-quarter comparison shows that coal production increased by 21.5 percent (91, 867 tonnes) from 427 286 tonnes recorded during the fourth quarter of 2023.

Copper-Nickel-Cobalt Matte recorded zero production during the period under review. The affected mines are still undergoing provisional liquidation.

Table 2: Index of Mining Production for the First Quarter of 2024 by Mineral Groups and Minerals

Base:2013=100						
Mineral	Weights (2013)	Jan-Mar 2023	Jan-Mar 2024	Year-on-Year Percentage Change	Contribution (% points) to the Percentage Change in the total Mining Production	
Diamonds	82.5	120.8	87.8	(27.4)	(23.9)	
Copper-Nickel-Cobalt Matte	8.6	n.a.	n.a.	n.a.	n.a.	
Copper in Concentrates	5.5	211.4	176.7	(16.4)	(1.7)	
Gold	1.4	23.1	6.6	-71.3	-0.2	
Soda Ash	0.9	103.6	142.4	37.4	0.3	
Salt	0.5	70.7	82.8	17.1	0.1	
Silver	0.4	222.7	164.1	(26.3)	(0.2)	
Coal	0.3	172.4	138.8	(19.5)	(0.1)	
Total	100	114.3	84.9	(25.7)	(25.7)	

Note: 1. The contribution (percentage points) of a mineral to the percentage change in the total mining production is calculated by multiplying the difference in the index for the mineral by the weight of the mineral and then dividing by the previous period's total index.

2. () denotes negative numbers

3. n.a. signifies data not available/no production during the specified period.

3.0 Technical Notes

3.1 Background

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs, which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. With the discovery and successful exploitation of a sizable diamond kimberlite deposit at Orapa in 1971 and the production of copper and nickel at Selebi Phikwe in 1973, the economy transformed into a mineral dependent one. The Orapa mine was, by global standards, an exceptional deposit. In 1982, a second and much larger and richer diamond mine was opened at Jwaneng. Since the early 1980s, the mining industry has been the largest contributor to real Gross Domestic Product (GDP), contributing between 20 and 50 percent.

This mining sector, particularly the diamond industry, has played a pivotal role in shaping Botswana's economic landscape and development over the years. The high quality diamonds have been a resource instrumental in fueling economic growth, foreign exchange earnings, and job creation. Revenues generated from the sale of diamonds are reinvested into critical areas such as Education, Healthcare, and infrastructure development.

With such a significant contribution to the economic growth, the need for a measure of the change in the production of minerals in Botswana cannot be over emphasised. The index of the physical volume of mining production is such a measure that provides a relative change over time in mining production. The IMP can also be used as a deflator to calculate the GDP at constant prices.

3.2 Data collection

Data from mining establishments in the country are included in the mining production statistics published by the Department of Mines under the Ministry of Minerals and Energy. Statistics Botswana receives the data from the Department of Mines once data collection is complete. The mineral production data is used to compute the volume of mining production indices. After cleaning the data, producing statistical tables and reports in accordance with international standards and guidelines, Statistics Botswana packages and disseminate the information to consumers through the website.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals such as Diamonds, Copper-Nickel-Cobalt Matte, Copper in Concentrates, Gold, Soda Ash, Salt, Silver, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities, ISIC Rev 4, and the Central Product Classification (CPC) Version 2.

4.0 Concepts, definitions and methods

4.1 Index of the volume of mining productions

The index of the volume of mining production, which can also be referred to as the production index is a statistical measure of the change in the volume of production. The production index of a mineral group is the ratio between the volume of production of a mineral group in a given period and the volume of production of the same mineral group in the base period. The index form is used not only for intertemporal comparisons, but also for comparisons between countries.

It is worth noting that IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production, which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, which is typically one year, serves as the benchmark for comparing other periods and provides the weights for an index based on its values. The base period used in this brief is 2013 and it is set at 100.

4.3 Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4 Seasonal Adjustment

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular period.

The data produced are not seasonally adjusted. However, there is a further scope of producing and disseminating an additional seasonally adjusted series only when there is a clear statistical evidence and economic interpretation of the seasonal/calendar effects.

4.5 Year-on-Year Percentage Change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period.

4.6 Quarter-on-Quarter percentage change

Quarter-on-Quarter percentage change in a variable for any given period is the rate of change expressed over the previous quarter.

4.7 Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then dividing by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.8 Rounding-off of figures

The figures in the tables have, where necessary, been rounded off to the nearest number shown. There may be slight discrepancies between the sums of the constituent items and the totals shown.

4.9 Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i \cdot W_i}{\sum W_i}$$

Where; I is the index, R_i is the production relative of item i and W_i is the weight allocated to item i

The production relative (R_i) of the i^{th} item for the quarter has been calculated by using the formula:

$$R_i = \frac{P_{ic}}{P_{i0}} * 100$$

Where P_{ic} is the production of the i^{th} item in the current quarter and P_{i0} is the production of the i^{th} item in the base year.
