## **PREFACE**

This report represents the twelfth annual installment in a series initiated in 2012, providing a concise overview of Botswana's Civil Registration and Vital Statistics (CRVS) system's operational performance and key demographic indicators.

The analysis encompasses all vital events occurring within the country's borders, regardless of citizenship. Certain indicators were derived from the 2022 Population and Housing Census, while the tabular and graphical data are grounded in vital event registrations recorded by the Department of Civil and National Registration (CNR) in 2022.

The report addresses three primary indicator categories: fertility, mortality, and marriage.

This publication is the outcome of a collaborative endeavor between Statistics Botswana and the Department of Civil and National Registration within the Ministry of Labour and Home Affairs (MLHA). This partnership has contributed to ongoing enhancements in the quality of vital events data.

---

**Dr Lucky Mokgathe**  
**Acting Statistician General**  
**January 2025**

## Acknowledgements

Statistics Botswana gratefully acknowledges the invaluable contributions of the Ministry of Health (MOH) for the diligent completion of birth and death notification forms, as well as the Department of Civil and National Registration (CNR) for providing the necessary data for analysis and report generation.

A special commendation extends to our development partners, including UNECA, UNFPA, UNICEF, AFDB, Plan International, and others, whose unwavering support has facilitated the advancement of the CRVS system through technical assistance, training programs, and funding initiatives over the years.

## EXECUTIVE SUMMARY

This executive summary provides an overview of the key findings and trends on births, deaths and marriages that occurred in 2022. The report aims to analyse indicators for these vital events to inform decision-makers and stakeholders about population dynamics and registration levels in the country.

### BIRTHS

There were 55,362 births registered in 2022 of which 49,258 occurred in 2022. Among all the births that occurred in 2022, 794 were still births.

Botswana had seemingly achieved a 100 percent birth registration from 2018 to 2021 due to the fact that 2011 population projections were used compared to the adjusted actual health facility births data used in 2022. The percent birth registration still shows remarkable results with 95.5 percent of births registered in 2022. Botswana is making significant strides towards the Sustainable Development Goal (SDG) target 16.9, which requires countries to provide legal identity for all, including birth registration by 2030.

The crude birth rate decreased from 25 births per a thousand population in 2021 to 20.5 births in 2022. While 49,258 births occurred and were registered in 2022, only 48,464 (98.4 percent) were live births. Live births decreased from 50,962 in 2021 to 48,464 in 2022 indicating a 4.9 percent decrease.

Additionally, the birth rate significantly decreased from 47.1 percent in 2021 to 23.8 percent in 2022 among the adolescent cohort. The sex ratio for stillbirths was high at 115.2 males per 100 females in 2022. The number of stillbirths decreased from 861 in 2021 to 794 in 2022. Only 17.0 percent of births in 2022 were to married mothers.

### MARRIAGES

The number of marriages decreased from 7,631 in 2021 to 5,642 in 2022, a 26.1 percent decline. About 93 percent of grooms and 97 percent of brides were marrying for the first time. Of the 5,642 brides, 12 needed consent from their parents or guardians as per the Marriage Act's requirements for those aged 18 - 20 years. The median age at first marriage was 41 for males and the comparable figure for females was around 36 years, an increase of 1 year from 2021 for both sexes. A Crude marriage rate (CMR) of 2.3 was estimated in 2022 implying that there were about 2 marriages per a thousand population.

In about 22 percent of unions, males were 10 or more years older than their female counterparts. Compared to spinsters (11.9 percent), Brides with prior marital status of divorced (22.4 percent) and widowed (32.0 percent) married younger grooms. About 7 percent of grooms were into a remarriage and the comparable figure for brides was 3 percent. About 90 percent of marriages were between partners who were both marrying for the first time.

The top three places in terms of marriage registration are Kweneng East, Serowe/Palapye, and Gaborone. Marriage statistics depicts a seasonal trend with high numbers of marriages being recorded in the summer season towards year end and low numbers of marriages being recorded mid-year during winter season

### DEATHS

There were 15,843 deaths registered in 2022 of which 13,924 occurred in that year. Death registration decreased from 100 percent in 2021 to 87.8 percent in 2022, representing a 20.8 percent reduction most likely due to use of the fixed overall estimate of deaths from the 2011 population projections.

The crude death rate declined from 6.8 percent to 5.7 percent during the same period. The Neo-Natal Mortality Rate stands at 12.6 deaths per 1,000 live births, while the Infant Mortality Rate is at 21.6 deaths per 1,000 live births. Furthermore, the Under-5 Mortality Rate stands at 27 deaths per 1,000 live births, highlighting the need for interventions to improve child health outcomes. However, disparities across districts persist, with Francistown reporting higher rates of infant deaths.

## CONCLUSION

The year 2022 marked a significant departure from pre-pandemic demographic trends. While the global health crisis began to recede, its lingering effects were evident in vital statistics. Notably, there was a sharp decline in birth rates, a concurrent surge in marriages, and a substantial increase in mortality rates. The COVID-19 pandemic's impact on these demographic indicators was both immediate and delayed, reflecting the complex interplay of factors influenced by the health crisis.

## 1.0. INTRODUCTION AND BACKGROUND

The Department of Civil and National Registration (CNR) is mandated with the registration of all vital events in the country and is the custodian of the civil registration system. Ideally, the events are to be registered immediately after occurrence, but there are instances where the event is registered at a later stage due to either a delay by the parent(s) or next of kin in submitting a completed form to the registry, or a delay by the registrar in processing the event

Birth, death and marriage registration data are a source of fertility, mortality and nuptial indicators. The data is used to produce indicators such as crude birth rate, total fertility rate, mean age at birth, nuptial births, marriage rate, mean age at marriage and infant mortality, under five mortality and Crude death rates etc.

### 1.1 The Impact Of COVID 19 On The Vital Events (Births, Marriages And Deaths)

COVID 19 virus was discovered in 2019 and measures to curb its spread in Botswana were put in place in 2020. Air travels in and out of the country were put on halt, work places were closed except for essential services, and the country went into a complete lockdown for about two months. A few cases were detected in the general public in 2020, and individuals who tested positive along with their contacts were placed under quarantine in order to keep restrain spread of the virus.

Although some of the measures were later relaxed, certain protocols remained in place to stop the virus from spreading, such as use of face masks, population movement restrictions both within and across the districts. As a result there were few or no COVID-19 deaths in 2020, and overall deaths in 2020 were decreased compared to 2021.

More deaths from the pandemic were reported in 2021 despite the protocols put in place and its impact was felt at different times for the main vital events, births, deaths and marriages.

#### 1.1.1 COVID19 Impact On Marriages

Marriages were directly affected by COVID 19 as couples were forced to postpone their marriages in 2020, as services could not be accessed due to tight restrictions implemented to curb the spread of the virus. After relaxation of some COVID19 restrictions in 2021, the department of CNR recorded a large number of marriages probably from the accumulation caused by deferred marriages. This resulted in a spike in the number of marriages in 2021. In 2022, Post COVID 19 phase, everything was normalized and the number of marriages dropped to what would have been predicted in the absence of the pandemic.

#### 1.1.2 COVID19 Impact On deaths

The spread of COVID reached its peak in 2021 resulting in increased number of deaths between 2020 and 2021. COVID 19 vaccinations were availed to the general public towards the end of 2021 into 2022 which resulted in a sharp drop in the number of COVID related deaths in 2022.

## **1.2. Source Of Data For The Report**

The three main sources of vital statistics are the civil registration system, population and housing census, and household sample surveys. Of the three, the civil registration system provides accurate, complete, timely, and continuous information on vital events. The data on vital events, (births, deaths, and marriages) analysed in this report, is sourced from the Department of CNR of the Ministry of Home Affairs (MHA) Department of Civil and National Registration.

## **1.3 Coverage of the Report**

This report analyses births and deaths that occurred in 2022 and were registered in the same year, those that happened in 2022 and were registered in the subsequent year, and those that happened in previous years but were registered in 2022 (delayed registrations). Births, deaths, and marriages, for citizens and non-citizens, which took place within the borders are also included. However, the marriages analysed in this report include only common law marriages. Cultural and religious marriages are not yet included.

## 2.0. CIVIL REGISTRATION SYSTEM

Civil registration is a source of legal documents that provide evidence used to protect human and civil rights, they are the prime source of longitudinal demographic data for a country to monitor progress towards key national and global goals. Botswana has a well-functioning civil registration system that produces vital statistics data that are continuous, permanent, compulsory, and universal. The existing CRVS legal frameworks are critical to the achievement of Sustainable Development Goals (SDG). This has a direct bearing on the production of sound and timely statistics for policy development, program monitoring and evaluation. Therefore, reliable vital statistics on the numbers, distribution of births, deaths, and causes of death, marriages and divorce are needed to inform social and economic planning across both public and private sectors.

The Government of Botswana regards Civil Registration and Vital Statistics (CRVS) System as critical to governance and public administration. The Civil registration system started in 1918 when the registration of births, deaths and marriages were undertaken resulting in the issuance of births and deaths certificates, marriage certificates on which an array of rights and privileges depends including the right to a name, citizenship and nationality. Through a series of interventions, significant progress has been made in raising the levels and comprehensiveness of CRVS including the establishment of a National Identification System (NIS) for citizens' identification. The NIS is linked to the Births and Deaths Registration System as the primary source of data for the issuance of unique identifier.

### 2.1. Mandate Of The Ministry Responsible For CRVS

The Ministry of Labour and Home Affairs through the Department of Civil and National Registration (CNR) is the custodian of all the civil registrations that occur in the country. Health personnel are responsible for completing notification forms for births and deaths which occur in health facilities and those brought in after occurrence of the event. The completed forms (CRB2 or CRD2) are then submitted to DCNR office to input the data into the system. For births and deaths which occur at home, confirmation letters from the village chief are required as a prerequisite by DCNR for registration.

The Department has these core functions:

- Registration of births, deaths, marriages
- Authorization of Change of Surname,
- Preservation, security, and custody of civil records,
- Registration and issuance of Birth, Death and Marriage Certificates
- Compilation of civil registration data
- Re-registration of people that have received legitimization and recognition
- Registration of societies,
- Registration and issuance of National Identity Documents.

### 2.2 Legislation on CRVS

There are several legislations pertaining to registration of vital events which are at different stages of review. The following are the main Acts and instruments governing registration and the management of vital events.

- Births and Deaths Registration Act (2001)
- Inquests Act (2001)
- Marriage Act (2001)
- Matrimonial Causes Act (2008)
- National Registration Act (2017)
- Children's Act (2009)
- Change of Surname Act (2021)
- Statistics Act (2009)

The Births and Deaths Registration Act Cap 30:01 enacted in 1968, and amended in 1998 and in 2004 is currently under review at the Bill stage. It provides for the compulsory and timely registration of births, still births and deaths that occur in Botswana. The Act provides for what is to be registered, when and who has to register such event. Registration of births and deaths is free for all if registered within the prescribed time, a certificate is issued for free. However, vulnerable communities in remotest areas are waved from paying for any of the charges that are required from those who register late. Late registration charges are intended to encourage people to register events when they are still fresh in their minds and can provide accurate information. The Marriage Act which establishes provisions for performing and registering marriages was last reviewed in 2004 and is also under review. The Matrimonial Causes Act, deals with many diverse issues related to marriage and the dissolution of marriage, including divorce was enacted in 1973, and last reviewed in 2008. The Children's Act was reviewed in 2009 and it is yet to be reviewed while Change of Name Act has been re-enacted, repealed and substituted with the Change of Surname Act of 2021. They are complementary legal instruments governing the registration of vital events and National identity. The National Registration Act was enacted in 1986, with additional amendments in 2017 for national identification registration.

### **2.3. Functions of the Births and Deaths Registration System**

The Births and Deaths Registration System (BDRS) is partially automated and decentralized to provide real-time data. It is interfaced with the National Identification System (NIS) for provision of the unique birth registration number allocated by NIS to a citizen child at the time of birth. This was introduced in 2004. The same unique identifier becomes the national identity number (Oman number) upon attaining the age of 16. The unique number provides a permanent record of a vital event for use by individuals and society from birth to death. To create demand, civil registration certificates, especially birth certificate has been attached to most of social benefits, such as enrolment at schools, applying for a passport, national identity cards, or for proof of age in the judicial court. A death certificate can be used to provide proof of death in order to claim inheritance or dissolution of deceased estate, proof in case of remarriage of surviving spouse.

### **2.4. Status of CRVS**

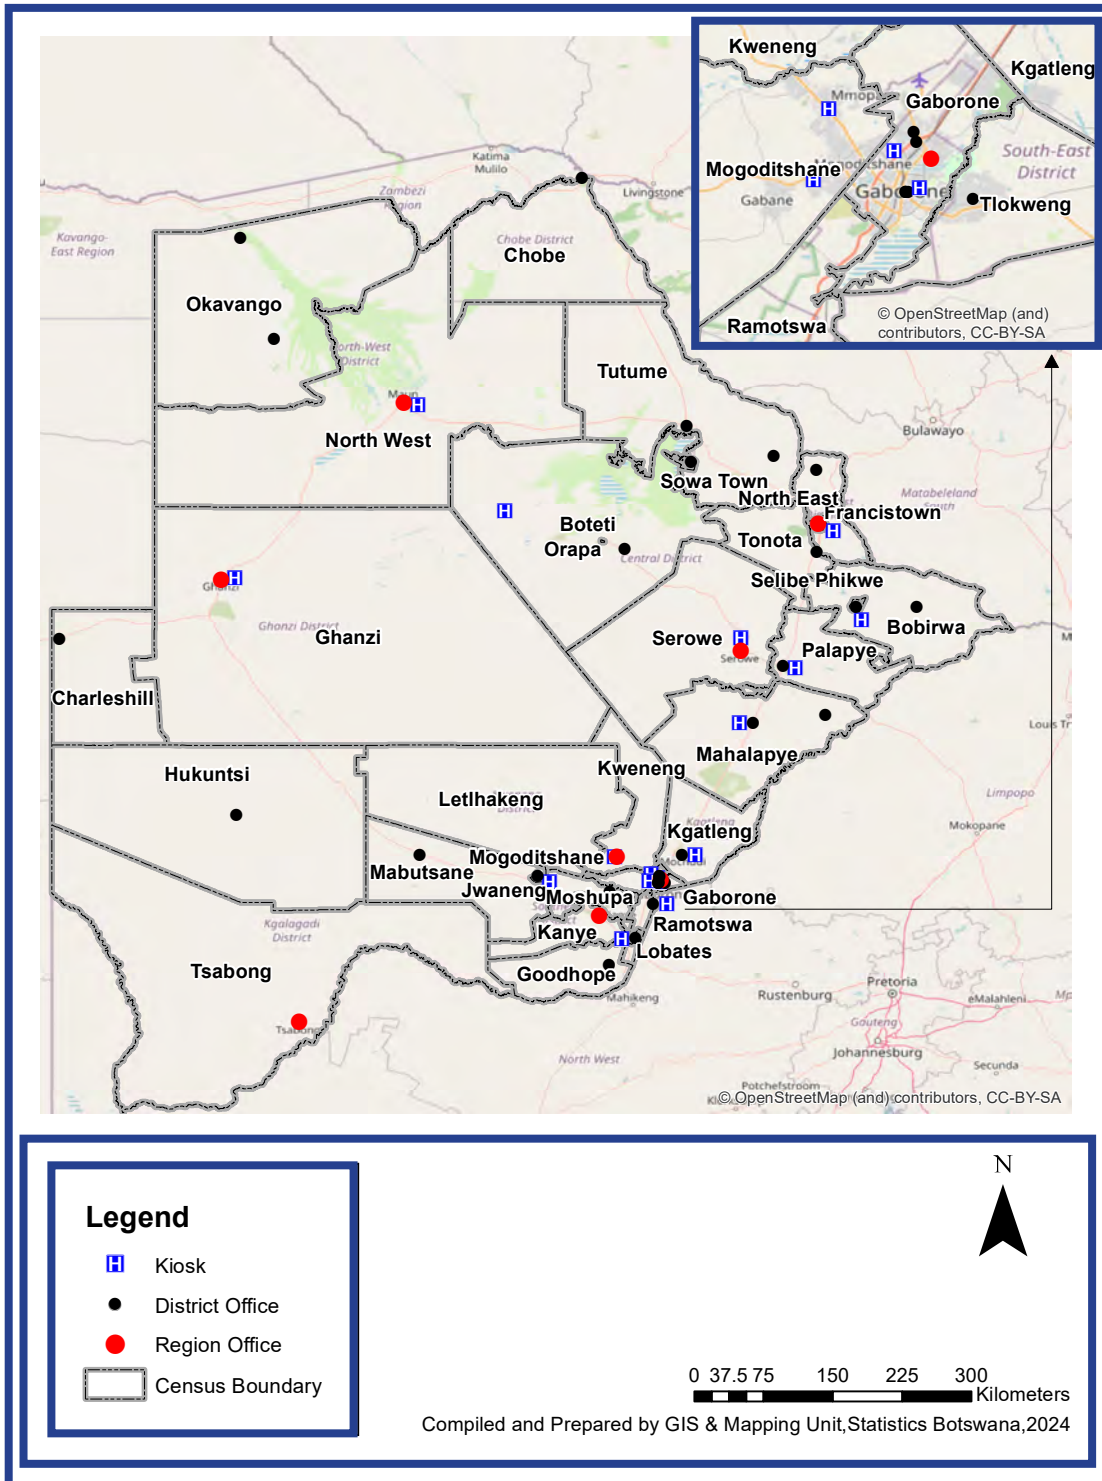

The Ministry of Labour and Home Affairs, through the Department of Civil and National Registration currently operates 36 District registration offices and 17 on-site registration at major health facilities and clinics across the country. The on-site registration initiative guarantees timely registration of births, still-births and deaths. Furthermore, having an institutional framework in place facilitates the smooth implementation of Civil Registration and Vital Statistics (CRVS) and Identity Management (ID-M) through a network of offices strategically placed across the country to ensure close accessibility of services to all.

The mobile outreach service exercises are being undertaken in collaboration with Development Partners and Civil Society whereby massive campaigns and on-spot registration are done in hard to reach areas (remote areas) targeting vulnerable and needy persons. This is meant to improve their accessibility to various social safety nets that are provided for all Batswana.

Following the declaration from the 4<sup>th</sup> CRVS Minister's Conference to among others for all African Union Member States to observe August 10 and commemorate it as Africa Civil Registration and Vital Statistics Day, Botswana commemorated the 3<sup>rd</sup> CRVS day on the 10<sup>th</sup> of August 2023. The commemoration was held in one of the remote areas in the country; Gudigwa village in the Ngamiland district. In advocating for the day several media campaigns were engaged to educate the nation on the importance of civil registration, publicise and mobilise the community for the day of event. The week before the event, activation as well as publicity were conducted through different media platforms such as Botswana Television, radio stations, and social media. The Department also visited some places such as Maun, Gumare and Shakawe to hype the event, registering and issuing birth and death certificates on the spot and also providing all other services rendered by the Ministry of Labour & Home Affairs. The event was held in collaboration with some key stakeholders being Statistics Botswana (SB) and United Nations Population Fund Agency (UNFPA.)

Fig 1. Registration sites in Botswana

**Onsite Registration points:** Scottish Livingstone Hospital, Princess Marina Hospital, Lesirane Clinic, Bokamoso Private Hospital, Sedilega Private Hospital, Deborah Retief Referral Hospital, Bamalete Lutheran Hospital, Athlone Hospital, Jwaneng Mine Hospital, Gantsi Hospital, Sekgoma Memorial Hospital, Mahalapye Hospital, Palapye Hospital, Rakops Primary Hospital, Nyangabgwe Referral Hospital, Selibe Phikwe Government Hospital, Letsholathebe Memorial Hospital.

## 2.5. Strategies to further improve births and deaths registration. The department:

- (i) Embark on continuous outreach programs on quarterly basis to register births and deaths and issue Certificates. This involves visiting districts and hard to reach areas including settlements and cattle posts. The program also provide an opportunity to conduct public education on the importance of registration of vital events.
- (ii) Collaborates with other government Ministries such as Ministry of Local Government and Rural Development, Ministry of Education and Development Skills and the Ministry of Health on their outreach missions to sensitize the public on the importance of registration as part of taking services to the people initiative.
- (iii) Collaborates with other stakeholders including Development Partners to commemorate the CRVS Day as an advocacy platform to advance legislative changes and awareness creation. It also seeks to improve access and coverage in areas with low registration rate through conducting mass registration a week prior to the commemoration Day.
- (iv) Conducts on time registration of births and deaths at established on-site registration sites to augment District registrations.

## 2.6 Solemnization and Registration of Marriages

Solemnization and Registration of marriages is regulated under the Marriage Act of 2001. The Act provides for registration of all marriages solemnized in Botswana including marriages contracted in accordance with any customary law of Botswana or Muslim, Hindu or other religious rites.

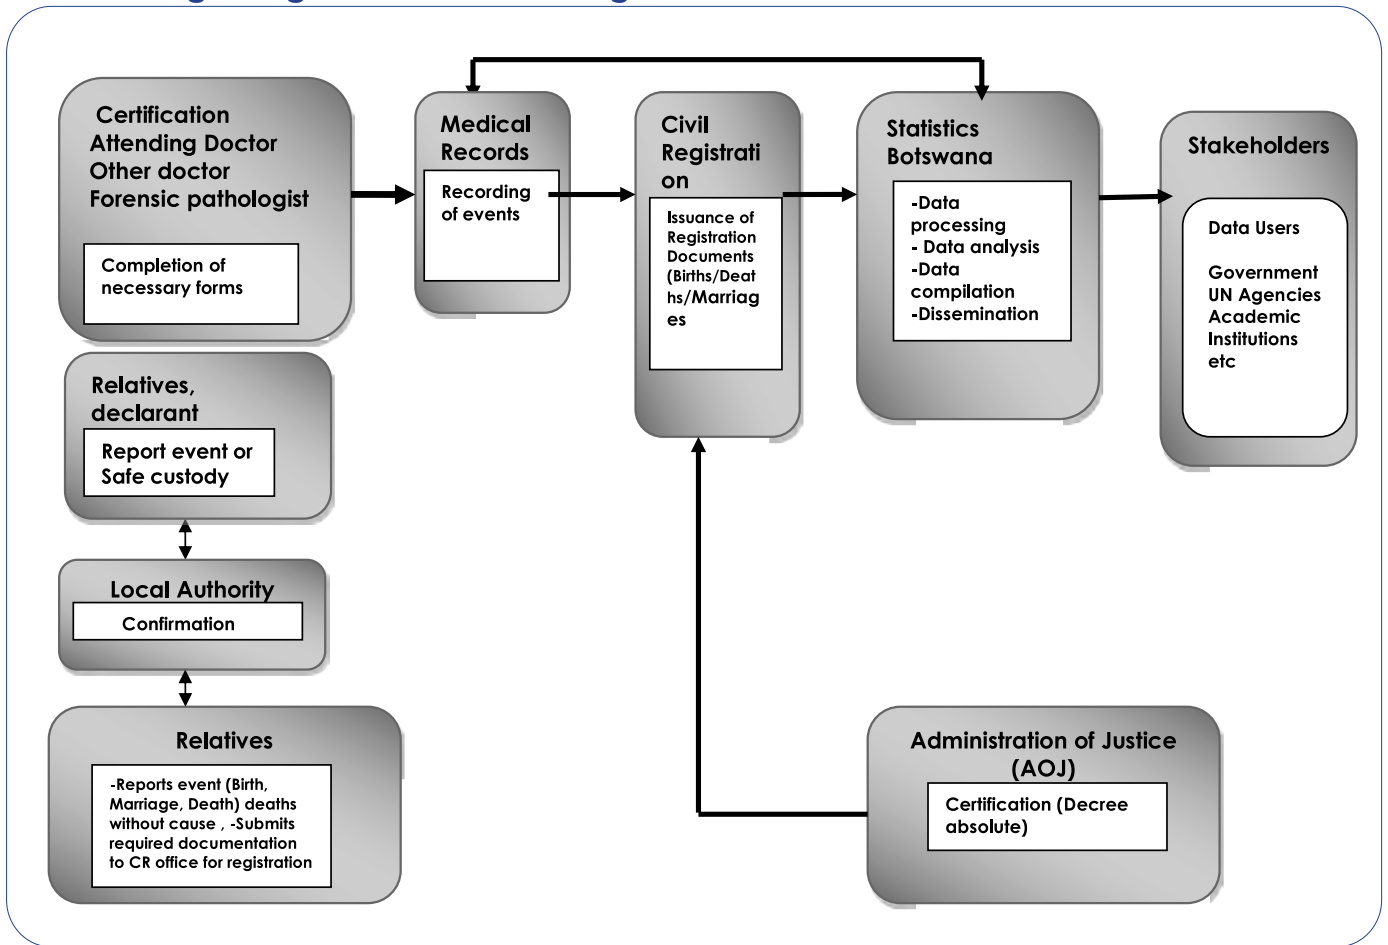

Persons who desire to marry each other approaches any DCNR Office nearer to them for the publication of banns which shall be in three successive weeks in a conspicuous place to which the public has access. Every marriage shall be solemnized in the presence of at least two witnesses competent to give evidence in a court of law. Some of the required documents for registration and solemnization of the marriage include the Decree Absolute Certificate for divorced partner, Death Certificate for the widowed, consent letter from parents /guardian for 18-20 year olds, valid National Identity document for citizens, valid passport and residence permit for non-citizens, letter of authorization from the District Commissioner for special license and a prescribed fee.

The Marriage Register is currently manual, however the Department is in the process of automating marriages as one of the Government Online services in order to increase efficiency on service delivery.

## 2.7 CRVS information flow

The below CRVS Structure shows the linkage between MHLA, AoJ, MoH and Statistics Botswana which are the main organizations involved in CRVS processes. The Ministry of Health (hospitals and maternity clinics) is responsible for completion of the births and death notification forms (CRB-2 and CRD-2 respectively) upon occurrence of birth and death. The Ministry of Labour and Home Affairs through DCNR then registers such births and deaths and subsequently produce and issue Birth and Death Certificates. DCNR then facilitates the Statistics Office with raw data in order to process it and produce annual statistical reports which also includes marriages.

Fig 2: Organisation of Civil Registration and Vital Statistics Work

### 3.0 DATA QUALITY, COMPLETENESS AND DEFINITIONS

The processes of data management starts from data collection and errors can occur at any stage of Civil Registration and Vital Statistics processes. An effective routine data assessment is crucial to evaluate data accuracy, completeness, consistency, and reliability. The data pertaining to deaths and births are obtained from health facilities. The doctor or midwife attending to the birth or certifying a death is expected to complete CRB-2 and CRD-2 Forms respectively after delivery or occurrence of a death. On completing the form, some variables are at times omitted or erroneously entered. The forms are then passed on to the CNR office where quality checks are made for the production of the legal document (Birth or Death Certificate). Most of these anomalies are more likely to go uncorrected because they do not form part of the document and as such do not stop the production of the certificate.

Most common omissions and errors passed are weight of the child at birth, gestation period, age of mother, educational level of mother, occupation of mother, and marital status of mother at time of birth, father's details, usual place of residence, causes of deaths and number of children born alive.

#### 3.1 Quality checks at data entry

After data checks, the forms are passed on for data entry. The data entry clerk enters the data and forwards the document to the supervisor for verification and authorization. The procedure is such that the supervisor checks the entries in the system against the CRB-2 and CRD-2 forms completed by the health personnel and if satisfied, authorizes for certificate production. It has been noted that during verification and authorization, the focus is more on variables that are required for the production of the certificate as compared to other variables that are important for the production of Vital Statistics. The errors that originated from the health facilities and those that might have been introduced by the clerk during data entry are then passed as authentic.

#### 3.2 Control functions in the system

There are control functions in the Births and Deaths Registration system (BDRS) to minimize the errors, however, there is an allowance to override and continue with the process of registration. This was done to avoid delays in issuing of certificate, as some of these variables are not needed for producing a certificate. The ideal solution would be to enhance the system indicate all entries that need revisiting for correction or completion.

#### 3.3 Improving of data quality

The data received from CNR is checked for accuracy and consistency, completeness and reliability. All data gaps and errors are identified through the use of excel. Data inconsistencies such as; age of mother below 12 years, Mothers with marital status of married at age below 18, unrealistic birth weights and gestation periods etc. are identified. Consistency checks can also be done by comparing data with that of other time periods. SB engages the CNR office to assist with the correction of the data.

SB officers undertake a physical follow-up to CNR offices to fill the gaps and correct the anomalies in the data. This involves pulling of the forms and making corrections. Only errors that were introduced by CNR office can be corrected at this stage. To correct the errors made by the health personnel, the CNR officers need to make consistency checks upon receipt of the form and make corrections immediately.

#### 3.4 Measurement of completeness of vital events

Civil registration completeness is the number of registered events divided by an estimate of the total actual/estimate vital events (births or deaths) in the population during a specific period of time. The Population and housing census data and projections data are used for the estimation of births, deaths and calculation of completeness of these events registration.

The completeness rate is defined as the percentage of registered events of the total number of events. The number of registered events is the number recorded by the civil registration system, whereas the number of actual events is estimated from the most recent population census or population projections or by using information from demographic fertility and mortality surveys.

$$1. \text{ Completeness rate for births} = \frac{\text{Number of registered births within the year of occurrence}}{\text{Estimated number of live births within the year}} \times 100$$

$$1. \text{ Completeness rate for deaths} = \frac{\text{Number of registered deaths within the year of occurrence}}{\text{Estimated number of deaths within the year}} \times 100$$

### 3.5 Definitions

**Live Birth** –refers to “the issuing forth of from the mother at any time of a child who, at any time after being wholly expelled from the mother, breathes or shows any other sign of life, or the issuing forth from the mother of a child, whether dead or alive, after the expiration of the twenty-eighth week of pregnancy (Births and Deaths Registration Act).

**Still birth** refers to 'any child who has issued forth from the mother after the expiration of the twenty-eighth week of pregnancy and did not, at any time after being wholly expelled from the mother, breath or show any other sign of life (Births and Deaths Registration Act).

**Nuptial birth-** refers to births by married mothers.

**Ex-nuptial birth-** refers to births to never married, widows and divorced mothers.

**Death-** The permanent disappearance of all evidence of life at any time after birth has taken place.

## 4.0 BIRTHS

Indicator	Measure	2015	2016	2017	2018	2019	2020	2021	2022	
Live Births	Male	Number	23,413	25,258	21,940	27,373	27,302	29,497	25,765	24,382

**NB:**The 2022 births were obtained from Botswana maternal mortality report 2022 and accordingly adjusted by percent health facility deliveries

### 4.1 Birth Registration

This section discusses the results of the analysis of all births that occurred within the borders of Botswana and were registered with the Department of Civil and National Registration (CNR) in 2022. The analysis focuses more on live births that occurred in 2022. Overall 55,368 birth both live and still born were registered, these include the current year (2022) and previous years.

A total of 54,567 live births were registered in 2022 (**Table B1**), this was a slight decrease (4.6 percent) compared to 57,207 that was registered in the previous year. Among the 55,368 registered births only 49,258 occurred in 2022 of which 1.6 percent were still births as shown in **Table 4.1**.

The total number of live births that occurred and were registered in 2022 was 48,464 a 4.9 percent decrease from 50,962 registered in 2021. **Table 4.0** shows that the number of births have been declining in the past two years, probably due to the impact of COVID as discussed earlier on.

	Live Born		Still Born		Total
	Number	Percentage	Number	Percentage	
<b>Sex of the Child</b>					
Female	24,082	50	369	54	24,451
Male	24,382	50	425	54	24,807
<b>Total</b>	<b>48,464</b>	<b>-</b>	<b>794</b>	<b>-</b>	<b>49,258</b>
<b>Sex Ratio</b>	<b>101.2</b>	<b>-</b>	<b>115.2</b>	<b>-</b>	<b>-</b>
<b>Percentage</b>	<b>98.4</b>	<b>-</b>	<b>1.6</b>	<b>-</b>	<b>100.0</b>

**NB:** Sex ratio (males per 100 females)

### 4.2 Recorded live births

Non-current births here refers to births that occurred earlier than 2022, but were registered in 2022. These accounted for 11.2 percent of the total births registered (**Chart 1**). This indicates the need for registration documents in a person's lifetime.

**CHART 1: Total registered live births by time of birth-2022**

### 4.3 Sex of the child

Literature supports the notion that the sex ratio at birth has consistently been above 100, indicating a higher number of male births compared to female births, which is considered a natural phenomenon. This is also supported by the World Health Organization (WHO) which estimates the 'expected' sex ratio at birth: in the absence of gender discrimination or interference to be around 105 boys born per 100 girls although this can range from around 103 to 107 boys per 100 girls.

Over the years the sex ratio has been fluctuating between 100 and 103. **Table 4.1** above shows that the sex ratio falls slightly below the expected sex ratio range with a ratio of 101.2 males per 100 females.

**Chart 2** shows that there were slightly more males than females among the 2022 registered live births.

**CHART 2: Percent registered births by sex-2022**

#### 4.4 Place of occurrence and place of residence

**Chart 3** displays the distribution of registered births that occurred in 2022 by the district of birth and the district of usual residence of the mother. The chart shows that in all cities and towns (Gaborone, Francistown, Selebi Pikwe, Jwaneng and Orapa) there are more registrations from other districts than within the same districts. The reverse is true for all other districts.

**CHART 3: Registered live births by district of birth and place of usual residence -2022**

**Chart 4** shows that 61 percent of registrations are births that occurred and were registered within the same district while the remaining 39 percent had the occurrence and the registration done in different districts.

**CHART 4: Registered live births by district of birth and place of usual residence-2022**

**Chart 5** gives a distribution of registered births that occurred in 2022 by registration centres. The registration centres at Princess Marina Hospital and Nyangabwe Hospital, which are major referral hospitals in the two largest cities of the country, continue to record the highest number of births compared to other districts. This elevated birth rate at these facilities could potentially be attributed to the sizeable population residing within their respective catchment areas and referrals from other districts.

CHART 5: Registered live births by registration centres -2022

#### 4.5. Mother's Age

Almost half of women who gave birth in 2022 were aged 20 - 29 years. **Table 4.2** shows that 182 mothers (0.4 percent) of all births in 2022, were menopausal women (45+ years). About 10 percent of all live births were to teenagers (10–19 years old). Multiple births accounted for about 2 percent of all births. Forty two of the multiple births were to mothers aged between the ages of 17 and 19. Adolescent birth rate stands at 50 per a thousand women in the 15-19 age group (**Table 4.0**).

**Table 4.2: Live births by result of delivery and age of mother-2022**

	Result of Delivery		
	Single Births	Multiple Births	Total
<b>Age Group</b>			
10	1	-	1
12	4	-	4
13	9	-	9
14	41	-	41
10-14	55	-	55
15	167	-	167
16	486	-	486
17	969	8	977
18	1,371	12	1,383
19	1,919	22	1,941
15-19	4,912	42	4,954
20-24	11,361	132	11,493
25-29	11,746	216	11,962
30-34	9,639	233	9,872
35-39	7,002	208	7,210
40-44	2,386	48	2,434
45-49	170	2	172
50-54	9	-	9
60-64	1	-	1
Not Stated	302	-	302
<b>Total</b>	<b>47,535</b>	<b>929</b>	<b>48,464</b>

#### 4.6 Month of occurrence

**Chart 6** illustrates the number of live births by month of occurrence in 2022. The results show that the highest number of births occurred in January accounting for about 9.3 percent of the total births while the lowest percentage of 7.6 percent was recorded in December.

CHART 6: Births by Month of Birth-2022

#### 4.7. Place of birth

Almost all the births occur in health facilities. This gives an indication that almost all births are attended by skilled personnel as recommended by WHO. This has also enabled the Department of Civil and National Registration (DCNR) to increase the registration coverage as occurrences are registered on the spot through the kiosks in the health facilities.

**Table 4.3** indicates that 99.8 percent of all live births in 2022 occurred in health institutions, with the remaining 0.2 percent occurring at home and this includes deliveries before arrival at health facility.

Age Group	Place of Birth		Total
	Health Facility	Home	
10-14	55	-	55
15-19	4,948	6	4,954
20-24	11,469	24	11,493
25-29	11,920	42	11,962
30-34	9,845	27	9,872
35-39	7,189	21	7,210
40-44	2,429	5	2,434
45-49	172	-	172
50-54	9	-	9
60-64	1	-	1
Not Stated	301	1	302
<b>Total</b>	<b>48,338</b>	<b>126</b>	<b>48,464</b>

#### 4.8. Marital status of the mother

**Chart 7** gives a graphical illustration of mother’s marital status at birth. The presentation shows that a larger proportion of mothers were single, this accounted for about 83 percent while 17.6 percent of births occurred to married mothers.

**CHART 7: Live Births by Marital Status of Mother-2022**

**Table 4.4** below further breaks down the legitimacy status at the time of birth by age of mother. The results indicate that about 59 percent of births occurred at ages 10-29 out of which 5.6 were within wedlock. The high percentage of out of wedlock births are exacerbated by the fact that marriages are delayed until ages of 35 (median age at marriage) for women as indicated in the marriage section **Table 5.2**.

	Legitimacy status				Total
	Within Wedlock	Percent	Out of Wedlock	Percent	
<b>Age Group</b>					
10-14	-	-	55	0.1	<b>55</b>
15-19	154	0.3	4,800	9.9	<b>4,954</b>
20-24	855	1.8	10,638	22.0	<b>11,493</b>
25-29	1,717	3.5	10,245	21.1	<b>11,962</b>
30-34	2,355	4.9	7,517	15.5	<b>9,872</b>
35-39	2,075	4.3	5,135	10.6	<b>7,210</b>
40-44	704	1.5	1,730	3.6	<b>2,434</b>
45-49	47	0.1	125	0.3	<b>172</b>
50-54	1	0.0	8	0.0	<b>9</b>
60-64	-	0.0	1	0.0	<b>1</b>
Not Stated	132	0.3	170	0.4	<b>302</b>
<b>Total</b>	<b>8,040</b>	<b>16.6</b>	<b>40,424</b>	<b>83.4</b>	<b>48,464</b>

**NB:** Births to widows and divorcees were counted with out of wedlock.

### 4.9 Birth Weight

Birth weight is one of the indicators of the baby's physical development. There is a range of expected weight at birth, which can give the doctor an indication of the baby's health, together with other indicators like head circumference and length.

The graph below shows that the majority of new-borns, approximately 38.5 percent, were born weighing between 3000-3499 grams. More than 10 percent of babies were born underweight (weighing less than 2500 grams). About 3.5 percent of the live births weighed 4000 grams and above.

**CHART 8: Percent Live Births by Birth Weight – 2022**

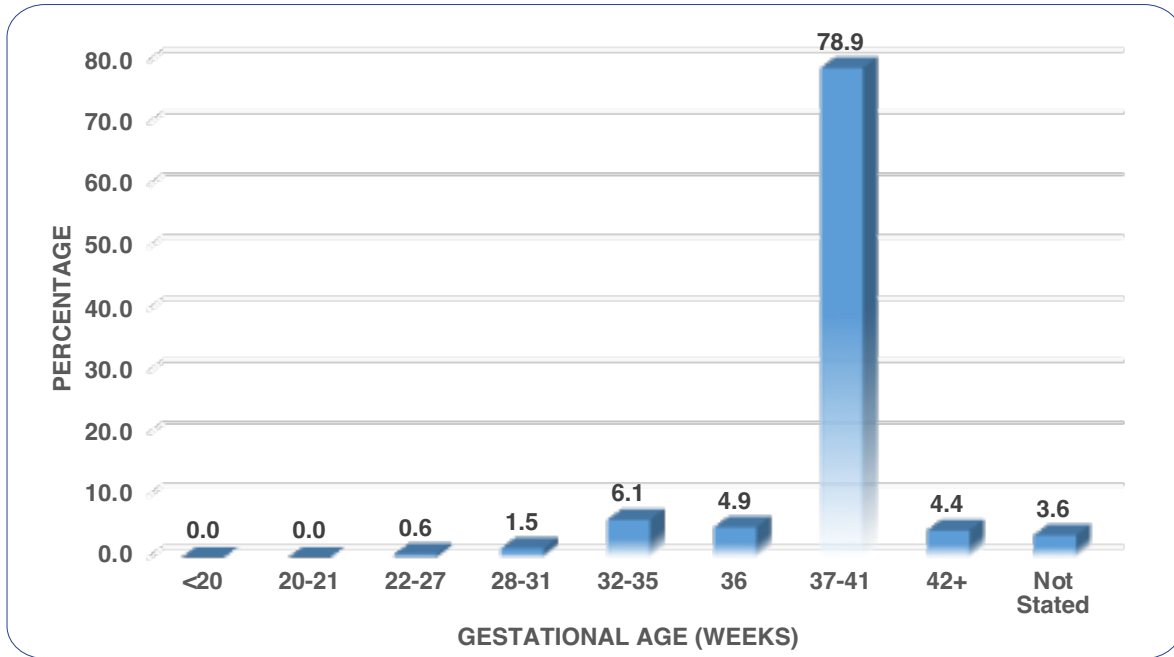

### 4.10 Gestational Age

The duration of gestation is measured from the first day of the last normal menstrual period. Gestational age is expressed in completed days or completed weeks (WHO).

Gestational age is the common term used during pregnancy to describe how far along the pregnancy is. The pregnancy is considered full term if it lasts for 37-41 weeks. Babies born before 37 weeks of pregnancy are considered preterm, whereas post-term refers to those who are delivered after 41 weeks.

**Chart 9** shows that the majority (78,9%) of infants were born between the gestational ages of 37 and 41 weeks.

**CHART 9: Percentage live births by gestational age-2022**

#### 4.11 Age Specific fertility Rate (ASFR) and Total Fertility Rates (TFR)

Age-specific fertility rates (ASFRs) are a fundamental demographic measure used to understand fertility patterns within a population. They represent the number of live births per 1,000 women in specific age groups during a given period usually a year. ASFRs provide critical insights into fertility behaviours across different age groups, helping demographers and policymakers assess trends, plan for healthcare and educational needs, and anticipate changes in population structure. Moreover, ASFRs are essential for calculating other demographic indicators like the total fertility rate (TFR), which estimates the average number of children a woman would have over her reproductive lifespan based on prevailing ASFRs. This information is crucial for understanding population growth, planning for future resource allocation, and designing effective family planning programs.

**Table 4.5** shows that there were 50 live births per a thousand women aged 15-19 in 2022. The fertility is high among the age groups 20-24 and 25-29 with each recording 116 live births per a thousand women in the respective age group. The Total fertility Rate stands at 2.4 births per a woman i.e. the number of children a woman would have at prevailing age specific rates through her lifetime.

Age Group	No. of women	2022 births	ASFR/1000
15-19	99,070	4,954	50.0
20-24	98,823	11,493	116.3
25-29	102,860	11,962	116.3
30-34	99,107	9,872	99.6
35-39	98,157	7,210	73.5
40-44	80,762	2,434	30.1
45-49	62,171	172	2.8
<b>Total</b>	<b>640,950</b>	<b>48,097</b>	<b>488.6</b>

**Total Fertility Rate (TFR)** = Total of age specific fertility rates per a 1000\*5 = 488,6\*5 =2442,8

## 5.0 MARRIAGES

Marriage is an event that is regulated by statute (under marriage Act 2001) and about which information is collected for legal and statistical purposes. Marriage is an institution recognized in Botswana where two adults (18 years and above) of different sex are united. The union is normally solemnized at the district administration offices, religious institutions and customary courts.

Marriage statistics are gathered through various methods, including vital registration systems, population censuses, household surveys, and administrative records. Generally, vital registration systems record births, deaths, marriages, divorces, and other vital events, providing official data on vital events. Population censuses and household surveys often include questions about marital status, age at first marriage, and other demographic variables, offering comprehensive insights into marriage patterns

Marriage statistics provide insights into the formation of family units. Over the years changes in these statistics are minimal, highlighting gradual changes in the age at which people seek to marry for the first time, whether they would like to go through the normal process of publishing intent to marry or opt for special license, whether they would like to marry in church or at the administration office.

Marriage statistics provide information on demographic characteristics such as age, sex, and usual residence, month of marriage and marital status at time of marriage. Analyzing these demographic variables help identify trends, seasonality of events, fertility, and family stability among others.

### 5.1 Trends in Marriage (2011-2022)

**Chart 10** depicts a steady increase in number of marriages from 5,333 marriages in 2013 to 5,642 marriages in 2022 with a sharp increase to 7,631 marriages in 2021. This sharp escalation came after relaxation of movement restrictions that were put in place to curb the spread of COVID 19 that was rampant then. Most Civil and National registration services were halted during the country's lockdown and movement restrictions in 2020. Deferred marriages that had already been published resulted in a backlog of marriages that were eventually formally sealed in 2021. The number of marriages however decreased by 26.1 percent from 2021 to 2022.

**CHART 10: Total number of marriages registered: 2013-2022**

### 5.2 District of Registration

The district of registration is not necessarily the place of usual residence but can be any place chosen by the marrying couple. In most cases marriages are solemnized at the bride's place of origin or home village.

Kweneng east, Serowe/Palapye and Gaborone recorded the highest proportions of marriages with each recording around 11 percent of all marriages solemnized in 2022. This might be due to the fact that they are highly populated districts compared to the rest.

**CHART 11: Percentage distribution of marriages by district of registration - 2022**

### 5.3 District of usual residence of bride and groom – 2022

**Chart 12** shows the distribution of marriages by district of usual living at the time of marriage. The figure shows that in most cases the bride and groom reside in the same district. The opposite is true for the three mining towns namely, Orapa, Jwaneng and Sowa, probably due to the population composition in the areas. More men than women are attracted to these towns because of the nature of jobs offered, with mines being the largest employer. However, other districts such as Francistown, North East and Kgalagadi North, also had, more marrying couples residing in different districts at time of marriage than those who are from the same district.

**CHART 12: Marriages by place of usual residence of bride and groom -2022**

### 5.4 Month of Registration

**Chart 13** shows that marriages are more prevalent during the last four months of the year and in April. The top three months in ranking are December, April and September probably due to the long public holidays celebrated during the months. There is low activity during the winter months which cover the months of May to August.

**Chart 13: Registered marriages by month of registration – 2022**

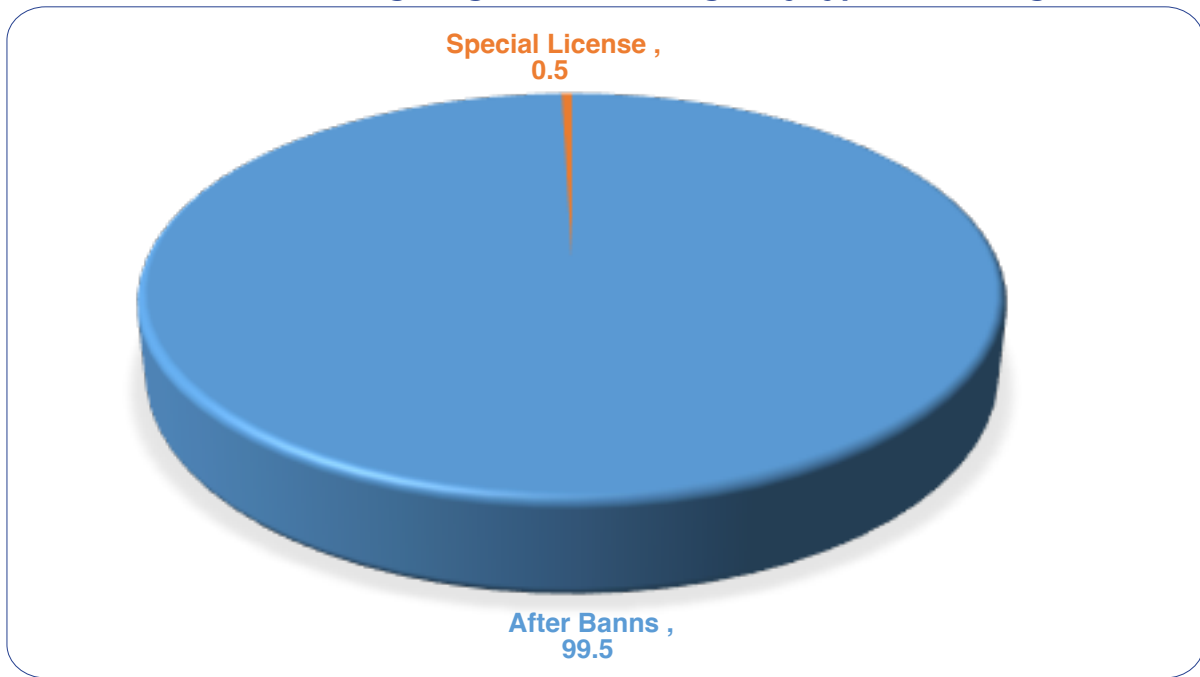

### 5.5 Type of Marriage

The marriage process requires that a public notice of intention to marry be publicized for a period of at least three weeks before the solemnization and this is referred to as publishing of bans. The bans are meant to sanction anyone to raise any civil or legal impediments to the marriage, to prevent marriages that are invalid. The alternative way would be to apply for special license, which allows one to marry without the public notice, anytime anywhere.

According to **chart 14**, publishing of Bans prior to solemnization of marriages is the most commonly used of the two with 99.5 Percent of the registered marriages publicized in that way.

**CHART 14: Percentage registered marriages by type of marriage – 2022**

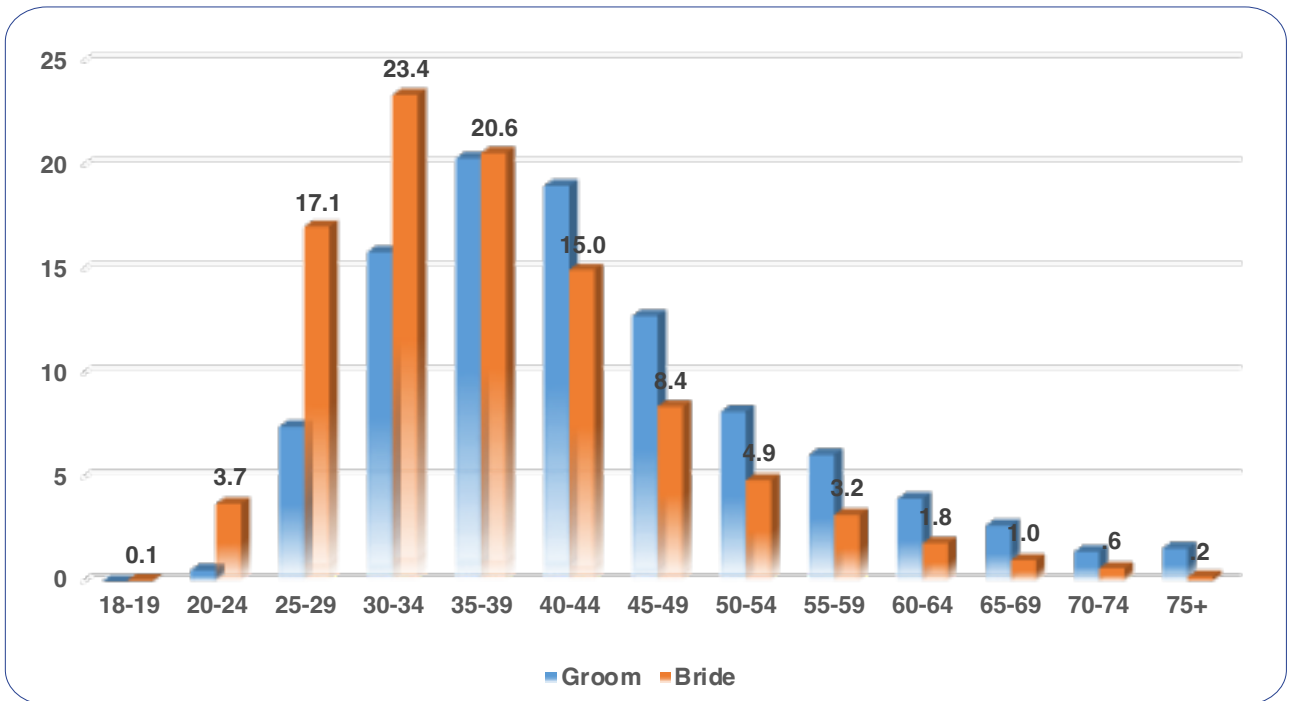

### 5.6 Age at the time of marriage

According to the Marriage Act (2001), No minor or person below the age of 21 years not being a widower or widow may marry without the consent in writing of his or her parents or guardians.

**Chart 15** shows that more women than men marry at younger ages (under 35 years) and more men than women married at older ages (35 years and over). About 65 percent of brides were aged below 40 years while the comparable figure for grooms was 44.2 percent.

**CHART 15: Percentage of marriages by age of bride and groom – 2022**

**Table 5.1** shows that there were 12 brides and only one (1) groom who needed consent from their parents or guardian as they were aged less than 21. The age group with the highest percentage of marriages is the 30-34 and 35-39 age group for females and males respectively

<b>Table 5.1: Percent marriages by age of husband and wife at marriage - 2022</b>				
Age	Male	Percent	Female	Percent

<b>65+</b>	<b>323</b>	<b>5.7</b>	<b>107</b>	<b>1.9</b>
<b>Total</b>	<b>5,642</b>	<b>100</b>	<b>5,642</b>	<b>100</b>

**Table 5.2** shows the mean and median age at first marriage for bachelors and spinsters from 2017 to 2022. The median age at first marriage for spinsters and bachelors both increased by 1 year from 35 and 40 in 2021 to 36 and 41 in 2022 respectively.

**Table 5.2: Mean and median age at first marriage 2017- 2022**

Year	Mean		Median	
	Bachelor	Spinster	Bachelor	Spinster
2022	43	38	41	36
2021	42	37	40	35
2020	42	36	40	35
2019	40	35	38	34
2018	41	35	38	33
2017	41	36	38	34

### 5.7 Age differentials

**Table 5.3** shows that, in the majority of marriages, the groom is older than the bride accounting for about 80 percent of the marriages. In seven of the unions solemnized in 2022, grooms were 15 or more years younger than their brides. In only 8 percent of the unions, partners were of the same age. About 22 percent of grooms were 10 or more years older than their brides, the comparable figure for brides is 0.6 percent.

**Table 5.3 Age differences between partners - 2022**

	Age Difference	No. of Unions	Percent
<b>Groom younger than Bride</b>	1-4	541	9.6
	5-9	119	2.1
	10-14	26	0.5
	15+	7	0.1
<b>Same Age</b>	0	451	8.0
<b>Groom older than Bride</b>	1-4	1,707	30.3
	5-9	1,534	27.2
	10-14	777	13.8
	15-19	329	5.8
	20+	151	2.7
<b>Total</b>		<b>5,642</b>	<b>100.0</b>

**Chart 16** also suggests that men tend to marry younger women irrespective of their marital status at the time of marriage. It is however interesting to note that, compared to spinsters, women who were previously married tend to marry men who are younger than they are. For example about 12.0 percent of grooms were younger than their brides whose marital status was spinster at the time of marriage. The comparable figure for brides whose marital status was divorcee and widow was 22.4 and 32.0 percent respectively.

**CHART 16: Percent distribution of marriages by age differences between spouses and marital status at the time of marriage – 2022**

### 5.8 Previous Marital Status

**Chart 17** shows that majority of marriages were of bachelors and spinsters accounting for 93 percent and 97 percent respectively. Grooms who were either divorcees or widowers accounted for about 7 percent of remarriages and the comparable figure for brides was 3 percent.

**CHART 17: Marriages by previous marital status – 2022**

### 5.9 First Marriages and Re-marriages

**Chart 18** shows that 90.7 percent of marriages were first time marriages for both bride and groom, while 8.2 percent were first marriages for one partner. Remarriages for both partners accounted for the remaining 1.1 percent.

**CHART 18: First marriages and re-marriages – 2022**

### 5.10 Crude Marriage Rate (CMR)

The crude marriage rate is the ratio of the number of marriages during the year to the total population in that year. The value is expressed per a 1000 persons. Marriage rate helps gauge the prevalence of marriage within a society and how it changes over time. It should be noted that in the previous publications the CMR was calculated using the number of persons marrying which yielded higher rates.

**Chart 19** shows the Crude Marriage Rate from 2013 to 2022. In 2022 the CMR was 2.3 implying that there were about 2 marriages per a 1000 population. The highest CMR was recorded in 2015 with a CMR of 3.1 marriages per a 1000 population. It is interesting to note that despite the COVID19 pandemic the CMR increased from 2.6 in 2019 to almost 3 marriages per 1000 persons in 2021. The CMR then dropped to a low of 2.3 in 2022 (the start of the post COVID19 period).

**CHART 19: Crude Marriage Rate: 2013-2022**

## 6.0 DEATHS

The process of death registration is continuous, allowing for the registration of all deaths that have transpired within the country, regardless of whether they occurred in the past or within the current year. Upon the completion of death registration, the individual providing the information is presented with a death certificate, which is typically necessary for the settlement of the deceased's estate.

Data collection encompasses all deaths officially registered within a particular year, irrespective of the year in which the deaths occurred. However, the analytical focus predominantly centers on deaths that took place during the reference year, 2022, for the computation of significant demographic indicators such as the Infant Mortality Rate (IMR), Crude Death Rate (CDR), and others

**Table 6.0 : Deaths indicators 2014-2022**

Indicator	Measure	2014	2015	2016	2017	2018	2019	2020	2021	2022
Total Population	Number	2,149,255	2,185,903	2,219,732	2,254,021	2,288,656	2,323,493	2,358,445	2,410,338	2,422,554
Total deaths (projected)	Number	17,463	17,079	16,780	16,619	16,506	16,461	16,214	16,315	16,695
All current deaths (registered)	Number	12,177	13,030	12,825	12,386	12,609	13,185	12,219	17,590	13,924
Death registration	Percent	69.7	76.3	76.4	74.5	76.4	80.1	75.4	107.8	83.4
Neo Natal Mortality Rate	Rate	-	-	-	-	-	-	7.7	12.2	12.6
Infant deaths	Number	1,045	1,012	1,041	998	891	1,096	968	950	1,047
U5 Mortality Rate	Rate	-	-	-	-	-	-	20.5	23.4	27.0
Crude Death Rate (CDR)	Rate	5.7	6	5.8	5.5	5.5	5.7	5.2	6.8	5.7
Infant Mortality Rate (IMR)	Rate	20.8	21.3	23.0	21.8	16.4	20.3	16.5	18.6	21.6
Life expectancy at birth (males)	Years	-	-	-	-	-	-	-	-	72.3
Life expectancy at birth (Females)	Years	-	-	-	-	-	-	-	-	75.9

NB: NB: Deaths from 2014-2021 were sourced from Population projections 2011-2031 while the deaths for 2022 were obtained from the 2022 population and housing

- (a) Deaths per 1,000 population
- (b) Infant deaths per 1,000 live births

There were 15,843 deaths registered in 2022 of which 13,924 occurred in the same year. Deaths in 2022 accounted for a 20.8 percent decrease from the previous year. The decline in deaths from 2021 to 2022 can be attributed to the measures implemented by the government to mitigate the spread of COVID-19. Although these measures contributed to a reduction in deaths from other communicable diseases in 2020, the impact of COVID-19 was more pronounced in 2021, leading to an increase in number of deaths. However, due to availability of COVID-19 vaccines toward the end of 2021, the number of deaths was reduced in 2022 compared to 2021.

### 6.1 Death Registration

Table 6.0 and chart 20 shows a huge decrease in death registration from 107.8 percent in 2021 to 83.4 percent in 2022. This clearly indicates that pandemics and epidemics such as COVID and others tend to distort trends in some indicators, as they are not factored in when population projections are computed. It is therefore pertinent to use the information with caution.

**CHART 20: Percent Death Registration 2012-2022**

### 6.2 Deaths by sex of the deceased

There were more male deaths (7,288) than female deaths (6,636) resulting in a sex ratio of 109.8 male deaths for every 100 female deaths. Male deaths accounted for 52.3 percent of all deaths that occurred in 2022 (**chart 21**)

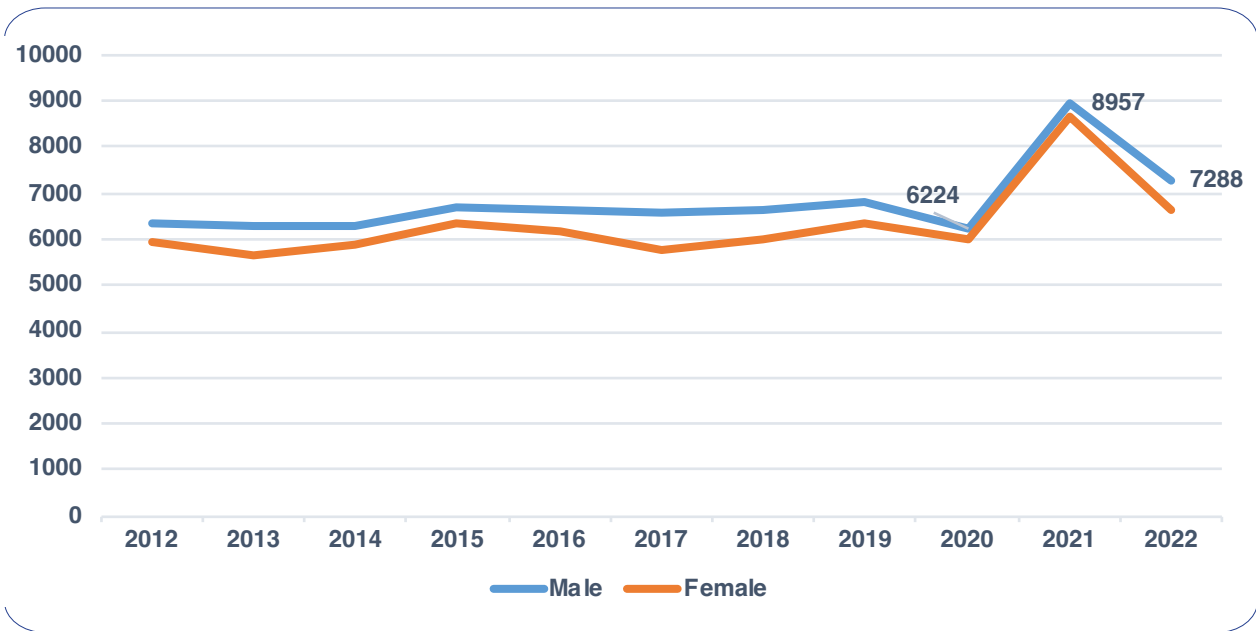

**CHART 21: Deaths by sex of deceased-2022**

The total number of registered male and female deaths decreased from 8,957 and 8,633 to 7,288 and 6,636 in 2021 and 2022 respectively. The provision of the COVID-19 vaccines contributed to the reduction of deaths in 2022 to expected levels in the absence of Covid19.

**Chart 22** illustrates a consistent trend in total deaths categorized by sex. Across all years shown, there were more male deaths compared to female deaths.

CHART 22: Deaths by Sex 2012-2022

### 6.3 Deaths by age and Sex

Chart 23 illustrates the distribution of deaths categorized by age and sex. Throughout all shown age groups, the 0-4 age bracket experienced more deaths than other age groups. The chart is skewed towards the males indicating more male deaths than females throughout the age groups up to age group 75-79. A noteworthy reversal of this pattern occurs at ages 80+, where female deaths surpass male deaths.

The 5-9 age bracket demonstrates the lowest proportion of deaths for both males and females with 0.4 percent deaths from that age group

CHART 23: Percent distribution of deaths by age and sex-2022

**Chart 24** presents a breakdown of deaths by age group for the year 2022. As indicated in **Chart 21**, males and females constituted 52 and 48 percent of the total deaths respectively. Within certain age groups, there exists a notable disparity between the males and females. For instance, males accounted for 67.3 percent of the total deaths within the 20-24 age group. From the age group of 20-24, the proportion of male deaths begin to decrease, while that of females' experiences an increase, ultimately converging at the 75-79 age group. From ages 75-79 the proportion of female deaths surpasses that of males, potentially attributed to the cumulative effect of female longevity resulting from lower mortality rates in earlier years.

**CHART 24: Percent Distribution of deaths within age groups by sex-2022**

### 6.4 Crude Death Rates by District of usual Residence

The Crude Death Rate (CDR) serves as a crucial indicator of mortality within an entire population and plays a significant role in determining population growth trends.

From 2021 to 2022, the crude death rate declined from 6.8 to 5.74 deaths per thousand population. Francistown recorded the highest crude death rate at twelve (12) deaths per thousand population, followed by Gaborone and Southern districts, each recording 7.5 deaths per thousand population. Sowa Town registered the lowest crude death rate of 0.4 deaths per thousand population, as depicted in **Chart 25**.

**CHART 25: Crude Death Rates by District of usual residence-2022**

### 6.5 Age Specific Death Rates

The Age-Specific Death Rate (ASDR) denotes the annual number of deaths per 1000 individuals within a specified age group, independent of the population’s age structure. Unlike the Crude Death Rate (CDR), the ASDR provides a more detailed understanding of mortality patterns within distinct age groups.

**Chart 26** illustrates that the ASDR remained relatively consistent between 2021 and 2022 for younger age groups, while showing a noticeable disparity for age groups above 45. The distribution of deaths by age reveals a reduction in mortality levels in 2022 compared to 2021.

**CHART 26: Age Specific Death Rates – 2021-2022**

### 6.6 Deaths by Month of Occurrence

**Chart 27** shows a comparison of percentage distribution of deaths by month of occurrence during the years 2021 and 2022. The percentage deaths were lower in July and August compared to the same months in 2021.

**CHART 27: Percent distribution of Deaths by month of Occurrence-2021-2022**

### 6.7 Infant Deaths by Month of Occurrence

Infant deaths by month for the years 2021 and 2022 show slight disparities (**chart 27b**). The highest percentage of infants' deaths in 2021 was 9.7 percent registered in January while the highest in 2022 was registered in June with a percentage of 10.6.

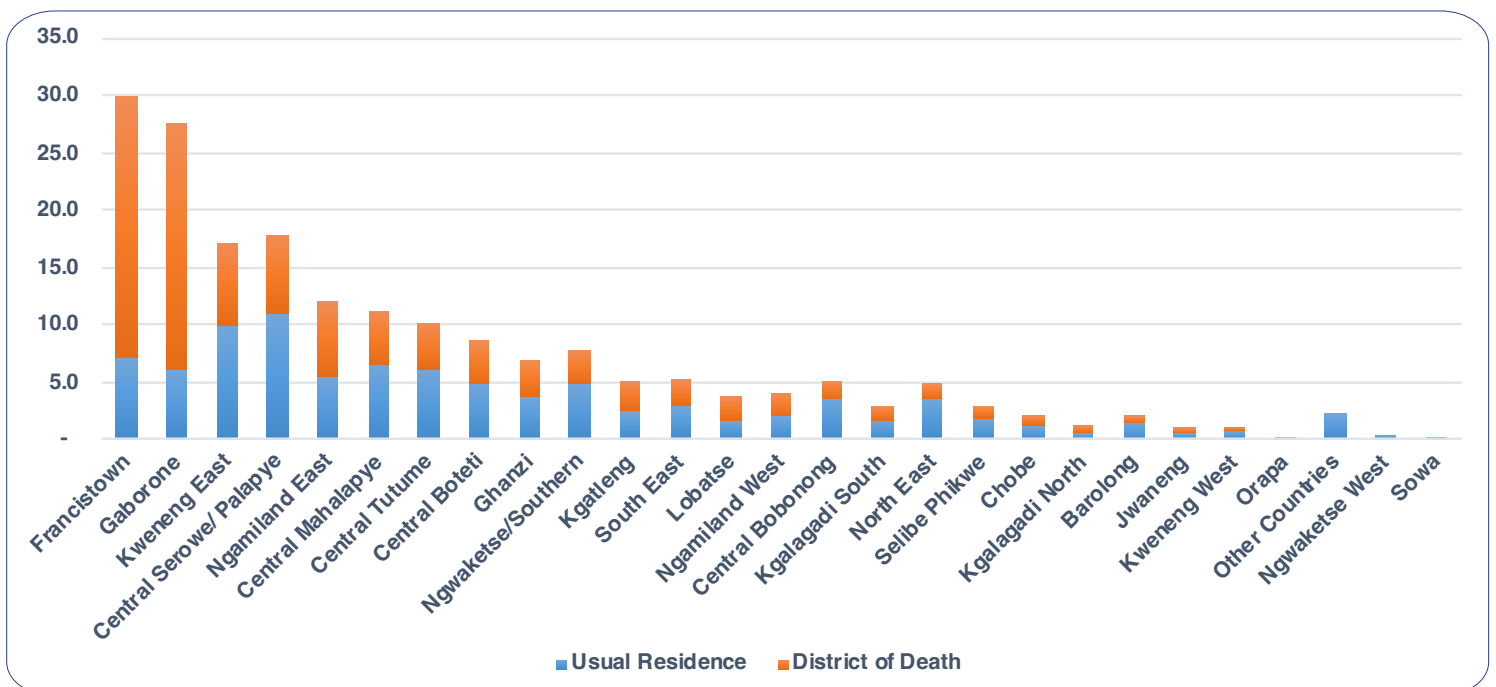

**CHART 27(B): Percent distribution of Infant deaths by month of Occurrence-2021-2022**

### 6.8 Infant Deaths by District of usual residence

**Chart 28** below shows the percentage of infant deaths registered by district of death and district of usual residence. Francistown registered the highest number of infant deaths in 2022. Gaborone and Francistown have the highest number of infant deaths who are not their usual residents. This could be due to referrals from catchment areas and other districts.

**CHART 28: Percent Distribution of infant deaths by district of death and district of usual residence-2022**

### 6.9 Timely, Late and delayed Deaths Registration

According to the Births, Deaths Act of Civil, and National registration (CNR), deaths are considered late if they are registered after the expiry of thirty (30) days from the date of occurrence. Delayed registration refers to all deaths that were registered after the 30 days but within the twelve (12) months of occurrence. Late registration are those that occurred in the past years.

**Chart 29** below shows that of all the deaths registered in 2022, about 99 percent were registered on time i.e. before a lapse of 30 days and about 1.0 percent were delayed registrations.

**CHART 29: Timely, late and delayed death registration -2022**

## 6.10 Place of death occurrence, marital status and Educational level

**Table 6.1** shows that 46.5 percent of all registered deaths occurred in health facilities compared to 43.7 percent in the previous year. About 58 percent were single at the time of death (children included). About 73.1 percent of the deaths were for people who had none or primary education as their highest level of education (children included).

<b>Table 6.1: Registered current deaths by place of death, marital status and level of education -2022</b>		
	<b>Number of deaths</b>	<b>Percent</b>
<b>Place of Death</b>		
Health Facility	6,474	46.5

Primary	4,964	35.7
Secondary	2,452	17.6
<b>Total</b>	<b>13,924</b>	<b>100.0</b>

## 6.11 Life expectancy

The commonly used index of mortality is the “expectation of life at birth.” This measure represents the average number of years a newly born baby is expected to live if the current risks of dying at each age remain unchanged. Alternatively, life expectancy at birth can be seen as the average age at death within a population, or the number of years a person born and living under specific socio-economic and mortality conditions can expect to live. It serves as a valuable indicator of both mortality rates and overall health conditions within a population.

Currently, the national life expectancy for females at birth stands at 76 years, while for males is 72 years, indicating a 4-year age gap between the sexes (**Table 6.2**).

<b>Table 6.2 :Life expectancy by sex and age group -2022</b>		
<b>Age(x)</b>	<b>Males e(x)</b>	<b>Females e(x)</b>
<b>0</b>	72.26	75.89
<b>1 - 4</b>	72.95	76.85
<b>5 - 9</b>	69.1	73.07
<b>10 - 14</b>	64.23	68.24
<b>15 - 19</b>	59.35	63.44
<b>20 - 24</b>	54.54	58.74

95+	0.05065	1	18.472	18.472	364.716	19.74

**Age-specific death rate  $M(x)$ :** The age-specific death rate represents the rate of death at a specific age. Here,  $M(0)$  is given as 0.02581. This means that out of 1000 individuals at age 0, approximately 25.81 are expected to die within the given time period.

**Probability of dying  $q(x)$ :** Similar to the age-specific death rate, the probability of dying represents the likelihood of dying at a specific age.  $q(0)$  is given as 0.02524, which translates to approximately 2.524% chance of dying at age 0.

**Survivors at exact age  $l(x)$ :** This indicates the number of individuals who have survived up to a specific age.  $l(0)$  is given as 100,000, meaning there are 100,000 individuals alive at the beginning of age interval 0.

**Number of deaths expected  $d(x)$ :** This represents the expected number of deaths within a specific age interval.  $d(0)$  is given as 2524, indicating that within the age interval 0, it is expected that 2524 individuals will die.

**Person's years lived  $L(x)$ :** This indicates the total number of years lived by individuals up to a specific age.  $L(0)$  is given as 97793, meaning individuals who have reached age 0 have collectively lived for 97,793 years.

**Period life expectancy  $e(x)$ :** The period life expectancy represents the average number of years remaining for individuals alive at the beginning of a specific age interval.  $e(0)$ , the life expectancy for males, is given as 75.89. This means that on average, males who are alive at age 0 can expect to live for an additional 75.89 years.
