## Preface

The second Botswana Literacy Survey was conducted in 2003 following the first one carried out in 1993. Like the previous survey it addresses issues that aim at improving socioeconomic status of the population. The reason for conducting this nature of survey every 10 years is to take on board all the initiatives made by the Government through literacy programmes, that are implemented by Department of Non-Formal Education, and other stakeholders, and also assess their impact and sustainability.

The main objective of the survey is to establish the extent at which the programmes that have been developed to improve literacy status in the country have been fully utilized. These programmes incluse the National Literacy Programme in the Ministry of Education. This goes a long way in also addressing the Vision 2016 goal of an educated and informed nation.

The report contains results of the literacy survey in Botswana, conducted during the period from October to December 2003. Recommendations, background information, survey methodology and sample characteristics and main statistical tables are presented as appendices.

## Used

A Majelantle
Government Statistician

July 2005

## Acknowledgement

The undertaking of a survey of this magnitude demands coordinated performance of several activities. Therefore, for effective supervision and coordination of activities, concerted coordinated efforts among individuals involved are of vital opportunity to express appreciation to all those who participated at different stages of the 2003 Literacy Survey.

Special thanks to:

- Research team: for their analysis and report writing. The team composed of Prof. Bagele Chilisa, Dr Johnson Nenty, Dr Tonic Maruatona and Dr Nnunu Tsheko.
- Members of the public: for their assistance and patience in providing required information.
- All field staff that worked tirelessly collecting and processing the information.
- All members of the reference and technical committes: for their commitment towards the successful completion of the survey from the planning stage to dissemination of results.
- All Department of Non-Formal Education staff: for their valuable participation and dedication throughout the survey satges.
- Last but not least all Central statistics Office staff: for their thoroughness in their application to the entire exercise.

## TABLE OF CONTENTS

EXECUTIVE SUMMARY ..... XII
RECOMMENDATIONS ..... XIV
1.0 BACKGROUND .....  1
1.1 LItERACY and Numeracy Conceptualisations .....  1
1.2 Why Literacy? .....  3
1.3 The History of Adult Literacy Work in Botswana .....  4
1.4 Literacy and Numeracy Assessment .....  6
1.5 Limitations of the Survey. ..... 9
1.6 Conclusion. ..... 10
2.0 SURVEY METHODOLOGY AND SAMPLE CHARACTERISTICS ..... 11
2.1 ObJectives of the Survey ..... 11
2.2 Topics Covered in the Survey ..... 11
2.3 Target Population for Literacy Test ..... 12
2.4 Sampling Frame ..... 12
2.5 Stratification ..... 12
2.6 SAmple Design ..... 12
2.7 Household and Individual Questionnaires ..... 13
2.8 Fieldwork and Data Processing ..... 13
2.9 Response Rates ..... 13
2.10 Age Distribution and Missing Data ..... 14
2.11 Characteristics of the Household Population ..... 14
3.0 SURVEY RESULTS ..... 15
SECTION A: ADULT LITERACY ..... 15
3.1 Population Distribution ..... 15
3.2 Botswana Adult Literacy Measures ..... 15
3.2.1 Policy Environment ..... 15
3.2.2 Adult Literacy Rates ..... 16
3.3 Age Specific Adult Literacy Rates ..... 17
3.4 District Adult Literacy Rates ..... 18
3.4.1 Gender differences ..... 18
3.5 Literate Population ..... 19
SECTION B: POPULATION THAT NEVER ATTENDED SCHOOL ..... 19
3.6 Population Population aged 10 Years and Over Who Never Attended Formal School ..... 19
3.6.2 Population aged 10 Years and Over Who Never Attended School By Age ..... 19
3.6.3 Reasons for Never Attending School. ..... 20
3.7 Population 10 Years and Over Who Never Attended School ..... 21
3.7.1 Never Attended Both Formal and Non-Formal School by District \& Sex ..... 21
3.7.2 Never Attended Both Formal and Non-Formal School By Age Group and Sex ..... 21
3.7.3 Major Reasons For Never Attending Both Formal And Non-Formal Schools By Sex ..... 22
SECTION C: POPULATION THAT DID NOT COMPLETE STANDARD 5 ..... 23
3.8 Major Reasons for Leaving School Before Completing Standard 5 ..... 24
3.8.2 Period Elapsed since Leaving School Before Completing Standard 5 ..... 25
3.8.3 Reasons for Leaving Formal School Within 4 years Prior to the Survey ..... 25
3.8.4 Population Never Attended or Left School By School Attainment, Age Group and Sex ..... 25
3.8.5 Population Aged 5 Years and Over Who Left School by Educational Level Completed and Sex. ..... 26
3.8.6 Age Distribution of Population Who Left School by Educational Attainmentand and Age ..... 26
SECTION D: PARTICIPATION IN ADULT LITERACY PROGRAMS ..... 26
3.9 Enrolment in Adult Literacy Programmes ..... 26
3.9.2 Reason for Never Attending Literacy Classes By Sex ..... 27
3.10 Access To Adult Literacy Programmes ..... 27
3.10.1 Attending Literacy Classes By Period of Attendance ..... 28
3.10. 2 Reasons for Missing Literacy Classes by Sex -2003 ..... 28
3.10.3 Reasons for Leaving Classes by Sex. ..... 29
3.11 Importance of Reading/Writing Skills by Sex -2003 ..... 29
3.12 READING AND ITS Sources ..... 30
SECTION E: LITERACY TESTS ..... 30
3.13 Participation in the Tests ..... 30
3.14 Determining the Literate Population ..... 31
3.15 Assessment of Literacy For Program Improvement ..... 32
3.16 Self-Proclaimed Literacy and Test performance ..... 33
3.17 Self-Proclaimed Literacy by Language and Test Results in Oral and Numeracy Skills ..... 33
3.18 Self-Proclaimed Literacy in Setswana Reading by district and Sex ..... 33
3.18.1 Self-Proclaimed Literacy in Reading English by district and Sex ..... 34
3.18.2 Self-Proclaimed Literacy in Setswana Writing by district and Sex ..... 34
3.18.3 Self-Proclaimed Literacy in English Writing by district and Sex ..... 34
3.18.4 Self-Proclaimed Literacy in Setswana Oral Test by district and Sex ..... 34
3.18.5 Self-Proclaimed Literacy in Oral English by district and Sex. ..... 35
3.19 Literacy Test Result Performance, By Subject Scores And Sex ..... 35
3.20 Eligible Population Who Failed Numeracy Test By District And Sex ..... 35
3.21 Eligible Population Who Failed Setswana Reading Test By District And Sex ..... 35
3.22 Eligible Population Who Failed English Reading Test By District And Sex ..... 35
3.23 Eligible Population Who Failed Setswana Writing By District And Sex ..... 36
3.24 Eligible Population Who Failed Writing In English By District And Sex ..... 36
3.25 Eligible Population Who Failed Oral Setswana Test By District And Sex ..... 36
3.26 Eligible Population Who Failed Oral English Test By District And Sex ..... 36
3.27 Competence In Setswana And English Reading, District And Sex ..... 37
3.27.1 Competence In Setswana And English Writing By District And Sex ..... 37
3.27.2 Competence In Setswana And English Oral, By District And Sex ..... 37
3.27.3 Competences in Numeracy By District and Sex. ..... 37
3.27.4 Test Result For the NLP ..... 38
3.27.5 English Reading, Writing and Oral ..... 38
3.27.6 Setswana Reading and Writing. ..... 38
3.27.7 Numeracy ..... 38
3.28 Test Results: NLP By Age Group And Sex ..... 38
3.28.1 English Reading Test by Age and Sex ..... 38
3.28.2 English Writing Test by Age and Sex ..... 38
3.28.3 Setswana Reading and Writing Test by Age and Sex ..... 39
3.28.4 Numeracy Tests by Age and Sex ..... 39
3.28.5 Test Results of Eligible Population by Attainment and Sex ..... 39
3.28.6 English Reading and Writing. ..... 39
3.28.7 Setswana Reading and Writing ..... 39
3.28.8 Oral Tests ..... 39
3.28.9 Numeracy Test ..... 39
SECTION F: LITERACY SKILLS ..... 40
3.29 Use of Literacy Skills ..... 40
3.29.1 Eligible Population By Type Of Material Read And Sex ..... 40
3.29.2 Eligible Population by Type of Work Written and Sex ..... 41
3.29.4 Eligible Population By Language, Reason For Never Writing and Sex -2003 ..... 42
3.29.5 Eligible Population by Language, and Future Reading Plans ..... 43
3.29.6 Eligible population who wish to take Setswana and English Lessons ..... 43
3.29.7 Reasons For Not Willing To Learn Setswana. ..... 44
3.29.8 Reason For Not Willing To Learn English By Sex ..... 45
SECTION G: LITERACY IN OTHER LANGUAGES ..... 45
3.30 Other Languages ..... 45
3.31 Economic Activity of Those Who Never Attended School or Left School Before CompletingSTANDARD 546
3.32 Economic Activity By Age and Sex ..... 47
3.33 Working Population by Major Occupation and Sex ..... 48
3.34 Trained Population By Course, Level Attained And Sex ..... 48
3.34.1 Working Population by Industry and Occupation ..... 49
3.35 Population Aged 10 Years and Over by District, Sex and Current Employment Status ..... 49
3.36 Employed Population, and Language Requirements For Employment ..... 50
3.37 Employed Population Requirements In The Current Job ..... 50
3.37.1 Employed Population Who Use Reading In The Current Job ..... 52
3.37.2 Unemployed Population by School Attendance and Sex ..... 53
3.38 Unemployed 10 Years and Over by Age Group and Sex ..... 54
SECTION H: DISCUSSION, SUMMARY AND RECOMMENDATIONS ..... 55
3.39 AdUlt Literacy Rates ..... 55
3.40 Population That Never Attended School ..... 55
3.41 Participation in the Literacy Program ..... 56
Access, Enrolment ..... 56
3.42 REASONS FOR AbSENTEEISM AND DROPPING OUT IN THE LITERACY CLASSES ..... 56
3.43 Literacy Tests. ..... 57
3.44 Determining the Literate Population ..... 58
Methodology ..... 58
3.45 Literacy Learning Environment ..... 59
3.46 Literacy in Other Languages ..... 61
3.47 Economic Activities, Employment and Training Opportunities ..... 61
3.47.1 Economic Activities For DNFE ..... 62

## EXECUTIVE SUMMARY

The 2003 survey indicated a national literacy rate of $81 \%$ compared to $68.9 \%$ in 1993 . The literate population among those with less than five years of education or never attended both formal and non-formal school was determined by computing their mean score in English and Setswana reading, writing and oral tests as well as numeracy. Mean scores for only those who took all the tests were computed. Only $3 \%$ of the eligible population took the tests. Performance in literacy tests increased the national literacy rate by only $1.6 \%$. This is possibly because $97 \%$ of the eligible population did not take the tests.

The data revealed that those who attended literacy programmes did better than those who never attended in all literacy tests except English writing. The majority proved that they could read and write and numerate. Most of them however, demonstrated minimum competence with only a few showing high competence. The English writing test recorded the highest number of people who showed high competence with Setswana oral recording the lowest number of people who demsontrated high competence.

There were, however, wide disparities of literacy attainment between the districts and by age. Town districts had high literacy rates while some districts like Ngamiland West and Kgalagadi South recorded rates below the 1993 national rate of $68.9 \%$. As in 1993, the literacy rates decreased with an increase in age. Females recorded higher literacy rates at younger ages groups 15-44 years, while males had higher literacy rates than females in the age groups 45 and above.

The data revealed that the proportion of the population 12 years and above who never attended school decreased significantly as compared to 1993. Major reasons for never attending school were: parents were unwilling and looking after cattle. The survey indicated that $10.7 \%$ of the eligible population never attended both formal and non-formal schools for reasons ranging from lack of time, not interested, not aware of facilities to parents not interested. The majority of those who left school before completing Standard 5 were females. Reasons for leaving school before completing Standard 5 were: loss of interest in school, lack of money, looking after cattle (affecting mostly males), and taking care of ill family members (affecting mostly females).

Data indicated that $71.5 \%$ of the eligible population never attended adult literacy classes compared to $81 \%$ in 1993. Major reasons advanced for non-attendance were that people were either not interested, there were no facilities in the area, they did not know the literacy classes existed or they did not have time to attend. These were also the main reasons advanced in the 1993 survey. At the time of the survey only $5.7 \%$ of population eligible for literacy were still attending while $22.9 \%$ had left the programme. Analysis by age showed that those still attending were 15 years and above while the few children $10-14$ years who had enrolled had dropped out of the program.

The National Literacy Program continued to attract more females than males. It was found that getting communication skills, getting a job and knowledge's sake were the main reasons for learning to read and write. The learning environment was however not conducive for learning. In Setswana, most people read religious books and newspapers. Respondents also wrote letters in Setswana. In English, they mostly had nothing to write and only occasionally wrote letters
and work related materials. Most of those who could not read or write had future plans to enrol in the National Literacy Program and workplace literacy. Major reasons for not willing to enrol in the National Literacy Program included being too old, poor eye sight, lack of interest and lack of time.

Data also indicated that people were literate in other languages apart from Setswana and English. The most popularly read langages were Ikalanga and Zezuru/Shona. There were laguages none of the repodents could read, such as Sebirwa, Setswapong and Sesubiya.

Finally, just like in 1993, the economic activities recorded, of the population 10 years and above who never attended school or left school before attaining Standard 5 were mainly of those whom never attended school ( $70.9 \%$ ). The major economic activity was home making carried out mostly by females. Most participants indicated that their occupations fell in the category of elementary occupations, craft making and agriculture. There were no female legislators. Unlike in the 1993 survey, in the 2003 survey, there were some females in the heavy plant and machine operator categories. About $37.7 \%$ of those employed revealed that reading and writing in Setswana were required for employment in their current jobs. In contrast $46.8 \%$ indicated that reading and writing in English was a requirement in their current jobs. Once employed the majority ( $65 \%$ ) of the employees regularly read and wrote in English and Setswana at their work place.

## RECOMMENDATIONS

## A. Adult Literacy

Recommendation 1. It is recommended that the disparities of attainment of literacy that exists between the districts be addressed and that Botswana should achive a national literacy rate of $95 \%$ by 2013. There is need to set literacy levels to be achieved by 2013 in districts with literacy levels below the national literacy rate. Priority should be given to those districts with literacy rates below the 1993 literacy rate of $68.9 \%$. Literacy rates of not less tan $80 \%$ is recommended for these districts. Furthermore, the frequency of conducting literacy surveys should be reduced from ten years to five in order to keep pace with the dynamics of the population, and also to provide more recent data and information to direct intervention programs.

Recommendation 2. Given the grave concern with literacy rates at some districts that indicated literacy levels that are lower than the national figure of 1993 Literacy Survey, it is also recommended that in-depth studies be conducted in these specific districts in order to get more information on why they lagged behind.

Recommendation 3. Data revealed that those 40 years and above had literacy rates below the national literacy rate of $81 \%$. It is recommended that literacy levels to be achieved by 2013 be set for this age group. A marked increase in literacy for this age group could significantly increase the literacy rate by 2013. The age specific differences in literacy rates have implications for curriculum planning, especially the types of materials that are developed in the adult literacy programmes. It is therefore recommended that research be carried out on age specific literacies and literacy materials and that the information is used to design literacy course materials that address and meet the needs of different age groups.

Recommendation 4. It is further recommended that literacy should be integrated in all extension services. For example, materials used in public education campaigns such as old pension forms, clinic cards, national identity card (Omang), passport application forms, forms used in land boards, posters, pamphlets, and HIV/AIDS publications should be translated into other languages and used in non-formal education classes.

## B Population That Never Attended School or Left Before Completing Standard 5

Recommendation 5: There is a total of 5,371 children aged $10-14$ years who have never attended both formal and non-formal school or who left school before completing Standard 5. These children are concentrated in Kweneng West, Ghanzi, Kgalagadi North and Central Boteti. The challenge is to provide 10 years of basic education as well as life skills and HIV/AIDS education to these children. During NDP 9 Government will 'construct and equip six out of school education resource centres for out of school education programs. It is recommended that in constructing the centres, priority be given to the above regions.

Recommendation 6. It is recommended that parents should also be involved in their children's learning in the non-formal education system as they are in the formal system

Recommendation 7. It is also recommended that DNFE should organize for a smooth transition of non-formal education learners to the formal education system at end of Primer 5.

## D. Participation In Literacy Programs

Recommendation 8. The results revealed that $71 \%$ of the eligible population never attended literacy classes. Reasons for never attending literacy were as follows; 'not interested', 'lack of time', 'no facilities, 'parents not interested' and 'did not know it existed'. It is recommended that DNFE adopt more flexible time schedules to suit the lives of learners and involve them in developing materials to enhance their interest in the programme. Further, the DNFE should collaborate with non-governmental organizations and other extension departments for developing various materials to be used in the program.

Recommendation 9. In order to enhance enrolment, it is recommended that the literacy class size be reduced from 15 to 5 , so as to accommodate learners from small settlements such as cattle-posts and lands as well as more remote areas where quotas of 15 learners per class may not be found in the settlement.

Recommendation 10. There is a tendency for non-literate men not to declare their status. Thus, it is recommended that in designing the literacy program and its materials, DNFE and its stakeholders should address the stigmatization of non-literate men to encourage them to declare their status so that they can access literacy education services.

Recommendation 11. The few children aged 10-14 years who enrolled dropped out of the program. It could not be determined if the children who dropped out of the literacy program had enrolled in the formal school system. It is recommended that future surveys include questions on the rates of enrolment of primary age children in the literacy program and their transfer to the formal primary education system.

Recommendation 12. It is also recommended that the next literacy survey should include questions that would investigate the effect of new national cost-sharing policy on the increase or decrease in non-attendance and its impact on the national literacy rate.

Recommendation 13. The survey found the following as the major reasons for missing literacy classes: 'Ill-health,' 'no instructor,' 'taking care of a family members,' all these factors affected more females than males. It is recommended more effort be directed to recruitment and retention of instructors in the literacy programme.

Recommendation 14. One of the major concerns in enrolments is the quality and the conditions of service of the Literacy Group Leaders (LGLs), it is recommended that the conditions of services for LGLs should be revised and the learning conditions be improved to retain both LGL's and learners. In addition, LGLs must be trained to a minimum qualification of Certificate in Adult Education.

Recommendation 15: Given the emergent nature of 'taking care of ill family members' as a reason for dropping out and absenteeism, it is recommended that there be an in-depth study to establish how HIV/AIDS and orphan care impacts on literacy attendance.

Recommendation 16: Drop Out Rates: Drop out rates in the literacy program were high. Their main reasons for leaving were as follows 'other reasons, 'lost interest', 'ill-health'; and 'looking after cattle' or 'working at the lands'. It is recommended that the DNFE consider conducting a small scale survey combined with focused group discussions with those who left the literacy programme over the years to establish why they left and what in their view, could be done to improve its delivery.

Recommendation 17. It is recommended that those looking after cattle or working at the lands should be taught at cattle posts and farms where they are working. Aspects of what is suggested are already taking place in the Chobe enclave villages and other places. The Department only needs to enlarge the scale and coverage to other places where it could be applicable.

Recommendation 18: It is recommended that an accountability system that involves the community leaders in monitoring LGLs be put in place. The system should assist in the hiring and monitoring of the activities of the LGLs to ensure that they actually teach at scheduled places and times in order to enhance community ownership of the programme.

## E. Literacy Tests

Recommendation 19. Given that English reading and writing and oral skills is a requirement for employment for a significant number of people, it is recommended that English reading and writing skills be introduced as early in the program as possible so that by the time participants are in Primer 5 they have acquired the basic skills required for literacy in the subject.

Recommendation 20. There were disparities of performance in the tests by districts, age and sex. It is recommended that district, gender, and age differences in performance be addressed. There is need to find out why performance improved with age and to use the information to develop enrichment materials and activities for those below the age of 45 years. Studies on the gender sensitivity of the curriculum and the tests used need to be carried out to fully understand sources of gender differences in performance.

Recommendation 21. It is recommended that efforts be made not only to increase the sample size taking the literacy test, but also to decrease the discrepancy in the number of participants who take each test item.

Recommendation 22. It is recommended That an alternate way of determining the literacy levels of participants based on their responses to literacy test items should be devised.

Recommendation 23. It is recommended that the Literacy Assessment and Monitoring Programme (LAMP) proposed by UNESCO be adopted to improve the assessment of literacy skills.

Recommendation 24. It is recommended that if this approach is adopted, planning for capacity building and test construction should start immediately in preparation of the survey due in 2013.

## F. Literacy Learning Environment

Recommendation 25. Most people never read anything mainly because they had nothing to read or because of poor eyesight. It is therefore recommended that there should be an increase in the availability of materials to be read. This can be achieved through introducing pullouts for neo-literates in Setswana newspapers or they could be inserted bi-weekly in the government daily newspaper. The DNFE could also work with the Botswana. National Library Service to extend the Village Reading Rooms to cover all parts of the country.

Recommendation 26. It is recommended that the concerned departments work with communities through drought relief to build appropriate shelters to store books and newspapers in rural areas.

Recommendation 27. It is further recommended that the scope of coverage for English teaching should be enlarged to include suitable materials for neo-literates, especially through the anticipated Adult Basic Education Course.

Recommendation 28. Most people did not write because they had nothing to write. It is therefore recommended that the DNFE introduce a newsletter to which neo-literates would contribute. The newspaper should be locally operated with Literacy Assistants (supervisors), literacy teachers and learners to edit it and take responsibility for its sale or free distribution to the local community. The anticipated net effect is for the newspaper to serve as an outlet for their writing skills and also to cultivate a literate environment.

Recommendation 29. It is recommended that DNFE work with other Non-Governmental Organizations to develop post-literacy materials in these languages for people to use in order to help preserve their culture and informally teach them to their children. This would be in line with one of the RNPE recommendations, which requested the DNFE to create a literate environment and support productive activities.

Recommendation 30. It is recommended that future national literacy surveys include questions on the operations and impact of functional literacy projects.

Recommendation 31. It is further recommended that work related writing be strengthened in order to make more impact on the participants economic situations. Females should be encouraged to start small businesses and use their literacy skills to engage in fruitful activities such as keeping books of accounts.

Recommendation 32. There were also those who had no plans to enrol for English or Setswana classes because of poor eye sight. It is recommended that DNFE work closely with the clinics and other health facilities to address 'poor eye sight'.

## G. Literacy In Other Languages

Recommendation 33. The survey found that people spoke and wrote in other languages such as, Ikalanga, and Sezezuru. It is recommended that where possible, DNFE should develop materials in other mother tongue languages for use during the initial stages of learning in the programme. It is hoped that later learners could be introduced to Setswana, which they need to improve their economic situations.

Recommendation 34. It is recommended that Government should have intervention programs to address issues of language and disability problems affecting learners. This intervention programme must include access to pre-school as recommended by RNPE of 1994.

Recommendation 35. It is recommended that DNFE work with Non-Governmental Organisations to develop post-literacy materials in other languages for people to use in order to help preserve their culture and informally teach them to their children. This would be in line with one of the RNPE recommendations, which requested the Department of Non-Formal Education to create a literate environment and support productive activities.

## H. Economic Activities

Recommendation 36. It is recommended that future surveys should include questions on the operations and impact of the functional literacy projects, which are part of the Department of Non-Formal Education activities.

Recommendation 37. It is recommended that more studies should be conducted on the relation of literacy to economic and social empowerment in order to help relate literacy content to the economic needs of the learners and the nation. These could be undertaken in between major literacy surveys. The survey should include aspects of social and health activities in the questionnaires to reflect the social life of people in relation to literacy.

Recommendation 38. It is recommended that the provision of Adult Basic Education Course (ABEC) as recommended by the Revised National Policy on Education (RNPE) be made a priority in order to enhance access to literacy education opportunities in Botswana.

Recommendation 39. It is recommended that the ABEC course use the economic activities, employment and training opportunities of the group to inform its future curriculum.

### 1.0 BACKGROUND

### 1.1 Literacy and Numeracy Conceptualisations

Literacy is a very dynamic concept. From the simplistic conceptualizations prevalent in the last century, in which the concept was understood as just reading, writing and basic numeracy, the concept is now understood from a broader perspective, encompassing a whole range of "more complex and diverse skills and understandings" (Lonsdale \& McCurry, 2004: 50).

Current research has come up with a proliferation of conceptions, definitions and models of literacy, depending on the schools of thought the proponents come from and what they are interested in achieving by the definitions. The kind of conception has implications on the models of provision of literacy programmes as well as assessment of capabilities. For example, some of the definitions "focus on the skills needed by the individuals for work, education, social interaction and negotiations of every day living". Such programmes adopt a "cognitive, individual-based model associated with a psychometric tradition, quantifiable levels of ability and a deficit approach to illiteracy, which is assumed to be both an outcome of individual inadequacy, and a casual factor in unemployment" (Lonsdale \& McCurry, 2004: 14)

Other definitions "focus on, the utilitarian literacies for specific contexts and purposes such as the workplace. Such conceptualisations attract models that are "economics driven, associated with workforce training, multi-skilling, productivity, functional literacy and notions of human capital [enhancement]" (Lonsdale \& McCurry, 2004: 14). The third category includes those which empower particular individuals and communities to change the status quo". Such programmes adopt "socio-cultural models associated with contextualised and multiple literacy practices, a valueing of the 'other' and a strong critical element" (Lonsdale \& McCurry, 2004: 14).

The trend of literacy understandings is moving away from just literacy for utilitarian purposes, for just some specific skill for increasing national productivity. It is important to address such issues as national productivity, but much more important to provide more skills for sustainable literate environments to facilitate a sustainably literate society.

### 1.1.2 Defining Numeracy

Numeracy is similarly a contested concept, depending on the premise from which the contesters understand and define it, as the case is with literacy. Those from the computational premise understand numeracy as elementary mathematics and consider it as "basic, superficial, commonly understood and concerned with the basic mathematics truths" (Coben et al. 2003:9) Those from the functional numeracy premise, emphasise numeracy for utilitarian purposes and therefore focus on "equipping the workforce with minimum skills required for industry and commerce". Those from the social premise understand numeracy as a social practice that derives meaning from the social contexts, i.e., the power relations, the ideology, the discourse, within which the concept is enshrined, believing that these shape the design of numeracy practices in a big way, that they determine what is worthy of numeracy teaching and learning.

There is some confusion between numeracy and mathematics. The tendency is to treat them as congruent or numeracy as a by-product of mathematics education, or numeracy as just some 'mathematical common sense". This is so because numeracy is context-specific. The level of innumeracy or numeracy of a people may not be easily assessed in computational tests involving manipulation of abstract concepts and symbols. Such tests need to be placed in context.

Numeracy is actually richer than mathematics. It is about:
-- making meaning in mathematics and being critical about maths. This view of numeracy is very different from numeracy just being about numbers, and it is a big step from numberacy or every day maths that meant doing some functional maths" It is about using mathematics in all guises - space and shape, measurement, data and statistics, algebra and of course, number - to make sense of the real world, using maths critically and being critical about maths itself. It acknowledges that numeracy is a social activity - - that numeracy is not less than maths but more. - - being numerate is being critical. (Tout 1997, quoted in Coben et al, 2003: 11)

Numeracy involves mathematical skills, but neutral mathematical skills alone, no matter how sophisticated and scientific they may seem, do not constitute numeracy. Being numerate is about dealing with ideology in mathematics, politicizing mathematics. It is much more than just computational skills. The current notions of literacy, as in "new literacy studies" (Allan Rogers), "critical literacy " (Paulo Freire, Alan Lankshear), "ideological literacy", "multiple literacies" (Brian Street), "discourse analytic literacy" ( Allan Luke, P Freebody, N Fairclough) do apply to numeracy, leading to concepts of "multiple numeracies", "social numeracies".

There is however, still no common definition of adult numeracy because of a lack of general consensus and competing discourse between researchers, practitioners and policy makers over what should constitute adult numeracy. Kanes (2002) has come up with a three fold distinction in which he places adult numeracy into three categories, He suggests terms like 'visible numeracy", which emphasizes use of commonly accepted mathematical language and symbols. This is typical of mathematics use in the classroom; "useable numeracy", emphasizing mathematics used in real-life problem solving. This kind of numeracy is complex and much more contextual. For example, it is the kind used outside the classroom and in real workplaces. The third category is "constructible numeracy" which is much more flexible and individually or socially generated, commonly in higher learning situations, developing higher order mathematical skills. According to Kanes (200), these must not be treated as in competition. A numerate person must be able to use them all, constituting a rich, broad numeracy ability.

Kanes' categorization has steered another tension, a dilemma for numeracy providers arising from constructibility and development of higher order mathematical skills versus useability of numenracy. It is a question of value attachment to a numeracy category, which the providers have to make careful decisions about. It is a choice about which value matters, for who, where and why. For example, the useable numeracy has a high use value but if not carefully designed, may not have a high exchange value i.e. it may not help one to move to higher mathematic learning. Similarly, the constructible numeracy has a high exchange value but may not have use value i.e. if not carefully designed, we may end up
with learners who have sophisticated, high order and abstract mathematical skills that they are not able to translate to their lives because the skills are not contextualised.

In the context of Botswana there is a shift from the conventional understanding in which literacy was defined simplistically as "the ability to read and write with understanding, in either Setswana, English or both; and ability to carryout simple computations in everyday life, (Gaborone et al, 1987:2). The country has moved to a wider understanding of literacy and numeracy which acknowledges the diversity and complexity in the nature of these concepts. Thus, for the purpose of the 2003 Survey, literacy has been defined as:

Literacy is a responsive and context specific multi-dimensional lifelong learning process designed to equip beneficiaries with specialised knowledge, skills, attitudes and technigues to independently engage in practices and genres involving listening, speaking, reading, writing, numeracy, technical functioning and critical thinking required in real life.

### 1.2 Why Literacy?

Literacy is not only a foundation of, but it is a very important baseline indicator for development. Literacy efforts must be related to various dimensions of personal and social life, as well as to development. They must be related to a comprehensive package of economic, social and cultural policies cutting across multiple sectors. What all this means is that success cannot be achieved in all areas of development without meaningful progress in literacy.

There is a powerful correlation between low enrolments, poor retention and unsatisfactory learning outcomes, and the incidence of poverty. . . (Dakar Framework for Action, pg 13).

It has been observed that literate families earn higher income, and are more empowered and generally more productive. In the area of gender disparities it has been observed that literacy empowers women. Not only are literate women more likely to challenge customs and traditional practices that have negative impact on their lives and are better prepared to claim access to different services, but also have greater awareness of their rights and take steps to defend them. Under-five mortality rates are also reported to be low in families which have mothers who are literate. These revelations and many more clearly show that literacy is not only an indispensable component of development at global level but also an important element at national, family and individual levels.

The literacy decade declaration views literacy as central to all development, a foundation for lifelong learning and a tool for empowering individuals and their communities. "Literacy is the common thread that runs the six [EFA] goals" (UN Literacy Decade: General Assembly Resolution 56/116, pg 4)

The Dakar Framework For Action also recognizes that
. . . education is a fundamental human right . . . key to sustainable development and peace and stability within and among countries . . . an indispensable means for effective participation in the societies and economies of the twenty - first century ( $\operatorname{Pg} 2$ ).

Botswana's committed response to these international literacy and education frameworks has generated policies and contextualised frameworks that recognize the reality of basic learning needs, comprising both essential learning tools and basic learning contents required by all people to be able to participate in their own development and improvement of their local economies.

As a country, Botswana's commitment as reflected in the Long-term National Vision 2016, is to achieve an "educated and informed nation". This will be achieved through a system of quality education able to adapt to the changing needs of the country, inline with the demands of globalisation. The country is also committed to achieve "a prosperous, productive and innovative nation through providing education system which allow the opportunity for continuities to develop productive skills'". As a result, the country commits to a diversified literacy provision.

Botswana also recognizes the role of literacy and basic education in the pursuit of the Millennium Development Goals Framework for Improvement of the relevance and quality of basic education, the achievement of universal access to 10 year basic education and the reduction of gender disparities in all education by 2016 as some of the top priorities of the Government in the implementation of this Framework. This is also reflected in the country's Revised National Policy on Education of 1994, which gives priority to universal access to quality basic education by the year 2015.

### 1.3 The History of Adult Literacy Work in Botswana

During the pre-independence period, adult literacy in Botswana was provided on a very small scale, conducted on a small scale by different organisations both governmental and non governmental. These were the Community Development and Welfare in the then Department of Education, the Botswana Christian Council, the Young Women's Christian Association, the Botswana Council of Women and the Lutheran Church of Botswana. A number of reasons such as economic problems, lack of political will and physical terrain were sited as some of the reasons which may have resulted in the limited support accorded to adult literacy provision.

Similarly not much was done in relation to adult literacy in the first ten years after independence. Direct action adult literacy provision began in 1977 and 1978 when the Botswana Extension College conducted two literacy pilot projects. The results of these projects indicated that there was popular demand for literacy in Botswana. These laid a foundation for literacy work that followed since.

The National Commission on Education of 1976, and the National Policy on Education of 1977 called for a major change in the education policy, the embracing of adult education and literacy in the education system to enable illiterate adults and out of school youth to access basic education. It was on the basis of this recommendation therefore that the Department of Non formal Education was established in 1979, subsuming the Botswana Extension College (First National Literacy Survey Report, 1993.) The Department of NonFormal Education established a nationwide literacy project, drawing from the literacy work previously done by the Botswana Extension College.

The initial objectives of the National Literacy Programme were:

- to eradicate illiteracy and to enable an estimated 250,000 illiterate adults and youth ( $40 \%$ of the population aged 15-45 years) to become literate in Setswana and numeracy within a period of six years, that is, 1980-1985.
- to enable the participants to apply knowledge in developing their cultural, social and economic life.
- to enable participants to perform community duties on one hand and to exercise the rights and obligations of citizenship on the other.

After another pilot phase in 1980, the Botswana National Literacy Programme was officially launched in June 1981 as the major government adult literacy initiative in the country. The Programme has since continued, with a variety of activities and fluctuating enrolments. Literacy was by then conceptualized as:
"the ability to read and write with understanding, in either Setswana, English or both; and the ability to carryout simple computations in everyday life". (Gaborone et al, 1987: 2)

During this period some achievements were experienced, the most significant one being the improvement of the National Literacy Programme (NLP), by the 1993 National Commission on Education, as an alternative to basic education provision.

The Revised National Policy on Education of 1994 recommended a significant transformation on the National Literacy Programme. The changes included the development of a comprehensive and examinable Adult Basic Education Programme, a course for out of school children equivalent to primary Education, and strengthening of post literacy and skills training for informal sector development. These changes were aimed:

- To provide education opportunities to out of school youth and adults with a view to address the problem of unequal access to basic education.
- To address the learning needs of urban and rural dwellers with emphasis on gender balancing and remote dwellers
- To enhance mobility between Non Formal and Formal education by establishing equivalence of certificate procedures between the two.
- To expand Non Formal Education curriculum beyond reading, writing and numeracy to include strengthened skills training, and income generating projects.

### 1.3. 1 The purpose of the Literacy Survey

The need to periodically establish the rate of adult literacy and the extent of inadequate literacy among the adult population of Botswana, as in other countries, cannot be overemphasised. Literacy and numeracy (for both adult and children) are important indicators of development and must be in every country's agenda for achievement of quality of life. Therefore, periodic literacy surveys are very crucial for monitoring and evaluation of literacy and educational achievement. In Botswana, efforts towards the achievement of national goals of Education for All, Vision 2016, the National Development Plan cannot be complete without a record of the nation's achievement in literacy and numeracy.

Until the early 1990s, the country depended on estimations based on the figures of people who never attended school and those who dropped out of school before the level of Standard 5. There were no literacy andnumeracy tests to establish the actual rate of adult literacy. Both national and international documents also reflected unconfirmed literacy and illiteracy estimations. For example, the UNESCO Compendium of Statistics on Illiteracy No. 31 (1990) shows an estimate of $26.3 \%$ illiteracy for Botswana while UNESCO Statistical Digest (1990) shows illiteracy estimations of $56 \%$ females and $63.1 \%$ males for $1970 ; 34.9 \%$ females and $16.3 \%$ males for 1988 . Kann and Taylor (1987) came up with a local estimate of $60 \%$ literacy rate. All these figures were unconfirmed since no literacy tests had been administered (First Literacy Survey, 1993).

A literacy and numeracy test was done on a small scale, by Gaborone et al, (1987) during the evaluation of the Botswana National Literacy Programme in 1986. The test was constructed basing on the contents of primers 3, 4 and 5 of the Programme. It was standardized using the primary education Standard Four attainment test as the norm. The test was triangulated with data from interviews with learners and DNFE personnel for background information. A total of 845 learners participated in the assessment. The main purpose of the test was to assess the effectiveness of the National Literacy Programme. However, the results of the test, though they indicated success, were inadequate to assess the country's literacy rate. The evaluation study recommended a national survey on literacy, which was conducted in 1993.

### 1.4 Literacy and Numeracy Assessment

The design of both literacy and numeracy tests is shaped by the conceptualizations prevalent. For example, in situations where narrow conceptualizations are held about literacy and numeracy, assessment will also implicitly assume the narrow approach which only focus on competencies which are characterized by simple reproduction of the literacy content and non-contextualised numeracy tasks. Scoring approaches in such situations will also adopt the two-scale pass-fail approach, condemning those who fail the tests, disregarding both the context of the test and that of the respondent. In situations of broader conceptualizations, assessment takes a broader approach, covering all the competencies ranging from decoding, meaning-making, application/pragmatics to discourse analytic and acknowledging the multiple literacies and numeracies that people exist within and live with. Assessment acknowledges that literacy and numeracy capabilities are not acquired in a vacuum and therefore they cannot be demonstrated in a vacuum.
. . . it is not just the task that is an indication of literacy, it is what the reader is expected to do with the task . . . the successful resolution of the action demanded by the task, that implies literacy. (Wickert, 1989: 6)

### 1.4.1 Developing Literacy and Numeracy Tests

This survey attemped to assess a balance of literacy and numeracy skills, competencies, attitude and behaviours from real life literacy and numeracy practices. It drew from Luke and Freebody's competencies.

- decoding competence: referring to the knowledge one has of the alphabet and grammatical relationships and other technological aspects such as the reading,
writing and numeracy conventions. These involve the skills of reading, dictation, identifying
- comprehension/semantic competence: refers to one's possession of knowledge resources and knowledge of how these resources can be orchestrated to create and communicate meaning.
- application/pragmatic competence: knowledge of how, where, with who and to what extent particular texts, numerals and genres can be used.
- discourse analytic (critical thinking) competence: the ability to critically analyse and evaluate texts and numerals. A metalanguage skill to be able to read between lines and detect ideologies and rhetoric, that is, how text can and do position readers.
- Technical functioning: the ability for one to use different kinds and levels of technology available to them.

This means that being proficient in decoding and meaning construction does not automatically make one familiar with the contexts and social practices in which particular genres and texts can be used. Similarly, being able to use particular texts in particular context does not automatically equip one with the knowledge and strategies for text analysis, critiquing, questioning, text interrogation and other such metalanguage literacy and numeracy strategies. Therefore none of these competencies should be compromised in literacy and numeracy learning, teaching and assessment.

The 1993 Survey was also criticised for failure to assess functional literacy abilities due to the narrow definition. The 2003 Survey has made an effort to include real life tasks or at least simulations of real life literacy and numeracy challenges in an effort to achieve assessment of functional literacy. The design of these tests has been guided by the definition of literacy shown in Item 1.1.2

As respondents are exposed to, and engage in various literacy and numeracy challenges, they are expected to demonstrate possession of literate and numerate competencies i.e. demonstrating possession of knowledge, skills, attitudes, behaviours and techniques deamed literate and numerate. They are exposed to practices which involve listening, Speaking, reading, writing, numeracy, - (covering addition, subtraction, division and multiplication [including concept of division as multiple subtractions and multiplication as multiple additions)], problem-solving, time reading and writing, comparisons), technical functioning, and critical thinking.

The tests were in the form of documents (forms), from which respondents are expected to identify and appropriately answer the questions that follow. These are meant to assess document literacy which is the competency to identify and process document information. They are also in the form of chunks of text (prose) to assess prose literacy that is, their competency to understand and appropriately use, analyse, interrogate information from chunks of texts such as articles, stories, etc. They are also in the form of calculations either with or without embedded text, to assess respondents' quantitative literacy.

### 1.4.2 Literacy Test Development

Since research has not been able to come up with generally agreed criteria for classifying people into literate, illiterate or semi-literate, the marks and scores that continue to be used in literacy assessment are largely arbitrary. However, this does not imply that there is chaos in the assessment of literacy. For example, in the more formalised school-based literacy programmes, assessment is guided by the curriculum-based content and materials used. Similarly, in the non-formal literacy programmes (especially for adults) assessment is inclined more "towards the measurement of 'every day' or practical literacy abilities" (United Nations Department of Technical Co-operation for Development and Statistical Office, 1989: 96). The latter assessment criteria require a very careful determination of the intersection of the skills of literacy acquired and the functions and uses to which literacy is put (the domains of literacy practice) in people's everyday lives.

The UN Department of Technical Co-operation for Development and Statistical Office (1989) notes that the skills that people use in their daily interaction with the written text involve the processes of decoding, comprehension, writing, location of information, and interpretation of the text which requires critical thinking and analysis skills. The kind of text domains that people use in their daily lives include words and sentences, such as those found in genres which include labels and single names of objects, signs and warnings, and short statements and messages in everyday life; prose texts such as chunks from books and newspapers; and documents such as forms, instructions and directions on recipes and drug packages and bottles; and others.

In the 2003 Survey, document literacy has been assessed by use of a medicine label and a designed form (the Literacy Survey Form). Respondents were requested to navigate their way through the forms, filling the required details. The forms were in both Setswana and English languages. Prose literacy was assessed by use of chunks of reading in which the respondents were requested to read through and answer the questions that follow (in both Setswana and English Reading Tests). Critical thinking was assessed posing a topical issue (e.g. on gender) and request respondents to advance their opinion and support this opinion. It is an oral test. Technological functioning was assessed by tasks that required respondents to explain orally giving a recipe or directions /instructions orally.

### 1.4.3 Numeracy Test Development

Similiar to literacy assessment, the assessment of numeracy is also based on the intersection of both numeracy skills and the domains of numeracy practice. Numeracy ability also involves the processes of decoding, writing, solving and location of information (UN Department of Technical Cooperation for Development and Statistics office, 1989). While numerate functions and practices may vary within and across societies according to the level of proficiency of individuals and the advancement of particular societies, there are some numeracy domains that seem to be common in most societies. These include written single or isolated numbers, numbers embedded in prose text, numbers in oral discourses and numbers embedded in documents.

The numeracy test in the 2003 study covered the skills of problem-solving with numeracy tasks embedded within text. The respondents were required to read the story and then work out the sums in both Setswana and English. Other tasks involved calculations using the common symbols of division and multilication. An extension of these symbols was a task to assess division as multiple subtractions and multiplication as multiple additions. The respondents were also given time reading and writing tasks in both languages. Lastly, respondents had to locate a list of items in grocery catalogues from two different
supermarkets, identify and compare the prices of the items and show which items cost less in which shop.

### 1.4.4 Scoring

There is still no universal procedure for assessing literacy. The assignment of scores to a literacy performance remains an arbitrary decision.

Does scoring above $50 \%$ on test a of paragraph comprehension qualify an individual as literate, illiterate or in-between? To a great extent, such labeling has been and continues to be arbitrary ((UN Department of Technical Cooperation for Development and Statistics office, 1989: 96).

The 1993 Survey was criticized for the cut-off right or wrong marking system. This survey considered the fact that literacy must be assessed in a continuum rather than just a two point scale of right or wrong, pass or fail. The score code ranged from no response, relevant attempt to correct answer. "No response" is awarded when there is no answer or no attempt completely or a completely irrelevant attempt. "Relevant attempt" is awarded when there is a partially correct attempt showing that the respondent understands or partially understands what the question requires but could not express the answer well due to, for example, shortage of vocabulary, spelling problems, low sentence building skills or slow reading/writing speed. "Correct answer" is awarded when the response answers the question correctly or with only minimal errors.

### 1.5 Limitations of the Survey

Some limitations have been observed in the 2003 study. A framework for assessment was fairly developed at the planning stage of the study. More of the intersections of the literacy skills and the literacy domains were captured in the assessment as compared to the 1993 survey. For example, the language tests covered reading and writing comprehension exercise, critical thinking and opinion seeking in both Setswana and English.

The Survey encountered some logistical problems, especially in the area of assessing technical functioning. For example, inaccessibility and differentials of technology availability and use in different areas of the country. In urban areas, there is more access to various types of technology than in rural and remote areas. Even if different local technologies were to be assessed, the Survey would have encountered time limitations to thoroughly design a standardized assessment for these technologies.

Despite the several scoring arguments and criticism regarding the scoring approach adopted to score the tests for the 1993 survey, the 2003 Survey still ultimately used the same approach to score the tests. The major limitations were encountered in the area of literacy levels. Only one test was designed to assess all literacy levels. This over-advantaged those with higher levels and disadvantaged those with lower levels. Another limitation was in the area of language used in the assessment, it was limited to only Setswana and English languages.

The development of tasks to be carried out in any literacy test is normally guided by the understanding and definition of literacy held by the programme providing literacy. The more inclusive definition of literacy currently held by the Botswana National Literacy Programme has to some extent, influenced the development of tests for the 2003 Survey.

The 2003 Survey tested advanced functional literacy skills as well as numeracy tests, covering mathematical concepts of multiplication, division, addition, subtraction, comparison, problem-solving and time. The next survey will strive to include more areas that were not covered in the 2003 Survey.

### 1.6 Conclusion

This literacy survey is a milestone towards the effort to provide a reliable data base for the National Literacy Programme, especially as it is among the first few literacy surveys to be conducted in the country. The report provides data in the areas covered in the objectives of the study and highlights areas that may require further action in terms of policies and prioritisation. As already mentioned in Section 1.6 of this report, the problems of literacy definitions have resulted in the content of the literacy tests not covering certain aspects of literacy and numeracy domains. However, this has been compensated by raising the pass mark for the tests. It is necessary that these issues of literacy conceptualisation and definition be revisited to pave way for future studies and provide clear conceptual and theoretical frameworks to guide literacy provision.

### 2.0 SURVEY METHODOLOGY AND SAMPLE CHARACTERISTICS

### 2.1 Objectives of the Survey

The survey was commissioned to collect data needed to measure the country's literacy levels by educational attainment at both formal school and non-formal schools, as well as by performance in the literacy tests for those to whom the tests were administered. In this survey literacy was defined as the ability to read and write in Setswana or English, or ability to carry out simple arithmetic computations.

1. To assess the effectiveness and impact of the National Literacy Program on the lives of Batswana.
2. To establish the effectiveness and impact of literacy at the workplace on participant's work related lives.
3. To asses literacy in Botswana as the continuum of skills and abilities.
4. To identify problems encountered in the implementation of the program and come up with strategies for future direction.
5. To assess socio-economic and cultural factors that may be associated with literacy problems in the adult, youth and children population.
6. To establish the rate of enrolment of primary school going age children in the literacy program.
7. To measure gender and age literacy differentials.

The survey data would provide, among others, baseline information on indicators of literacy levels, factors influencing adult literacy, and information necessary to guide decisions and policy formulations on national literacy programs.

### 2.2 Topics Covered in the Survey

Through consultations with stakeholders the following topics were agreed to form broad basis for addressing the objectives of the survey.

1. Demographic data
2. Educational background
3. Socio economic background
4. Nature of Literacy program attended
5. Impact of the Literacy Program (LP)
6. Workplace Literacy Program
7. Health and its impact on LP participation
8. Graduate rate for the LP
9. Dropout rate.
10. Rate of enrolment of primary age children into LP and their transfer rate back to primary education
11. Gender/age literacy differentials
12. Functional literacy

### 2.3 Target Population for Literacy Test

Literacy tests were applied to the population that was assumed not literacy, citizens of Botswana aged 10-70 years. For instance, those who never attended formal or non-formal schools, those who attended only non-formal school, and those who had completed standard IV or below at formal school. These were referred to as eligible population. Those who completed standard V and above were assumed literate and tests were not administered to them.

The UNESCO international definition of adult literacy sets age limits of $15-65$ years. However, the eligibility age was brought down to 10 years due to the fact that non-formal classes offered by Department of Non-Formal Education enroll people from the age of 10 years and above as most children at that age would not have enrolled in formal school due to various reasons. It was also meant to cover the age group $12-14$ years which is usually considered child labor analysis. This means that it is important in the analysis, to have a break down of literacy calculations by age groups of $10-70$ years and $12-70$ years for the Botswana case, and $15-65$ years for international comparison purposes.

The survey was designed to measure the country's literacy not only by the number of years spent at school (formal school) but also through objective testing of "Literacy Skills" as well as its utility value and numeracy. Literacy tests were applied to (i) Only Botswana Citizens (ii) 10-70 years old and (iii) Never attended or left school before completing Standard 5.

### 2.4 Sampling Frame

For BLS the sampling frame based on the 2001 Population and Housing Census. This comprised the list of all Enumeration Area (EA) together with number of households. In 2001 Census the EAs were framed of manageable size (in terms of dwellings/households). So the primary sampling units (PSUs) were EAs.

### 2.5 Stratification

Stratification was undertaken such that all districts and major urban centres become their own strata. With regard to increase precision consideration was also given to group EAs according to ecological zones in rural districts and according to income categories in cities/towns. Geographical stratification along ecological zones and income categories was expected to improve the accuracy of survey data in view that homogeneity of the variables within stratum was relatively high.

### 2.6 Sample Design

A stratified two-stage probability sample design was used for the selection of the sample. The first stage was the selection of EAs as Primary Sampling Units (PSUs) selected with probability proportional to measures of size (PPS), where measures of size (MOS) were the number of households in the EA as defined by the 2001 Population and Housing Census. In all 364 EAs were selected with probability proportional to size. At the second stage of sampling, the households were systematically selected from fresh list of occupied households prepared at the beginning of the survey's fieldwork (i.e. listing of households for the selected EAs). Overall $\mathbf{7 2 8 0}$ households were drawn systematically.

### 2.7 Household and Individual Questionnaires

The questionnaires are the primary recording documents of the survey. In the development of the questionnaires, along with the professionals, the other members (Including some users) were also invited. The final version of the questionnaires were finalized on the basis of the experiences gained from the Pilot Survey conducted using the drafted questionnaires for the survey. The 2003 BLS consisted of two questionnaires, namely
i. The Household Questionnaire, and
ii. The Individual Questionnaire

### 2.8 Fieldwork and Data Processing

(i) Fieldwork: A team of 12 officers trained the field staff for the Botswana Literacy Survey. Among the trainees there were 40 supervisors and 86 enumerators trained over a period of two weeks ( $15-24$ September 2003). Of the 86 enumerators, 65 were recruited for fieldwork, 15 for coding and editing duties.

There was eighty-nine field staff, comprising 29 supervisors and 65 enumerators. Nineteen (19) of the supervisors were permanent Central Statistics Office staff whereas the other 10 were permanent Department of Non-Formal Education staff. There were 28 teams of enumerators and one floating supervisor. The teams comprised mainly of two enumerators and a supervisor. Each team had at least one vehicle and a driver. Twenty-six (26) of the 28 teams were assigned 16 EAs each during the course of the survey. The remaining two (2) teams were designated as floating teams and they got assigned work as and when the need arose. The floating supervisor also got assigned work to supervise some enumerators particularly in areas where work was behind. Six (6) officers who were responsible for the quality control field visits supported the teams. The survey data collection was completed between 8th October 2003 and $23^{\text {rd }}$ of December 2003.
(ii) Data Processing: Data processing involved manual office editing and coding of answers to questions that were not pre-coded. It also includes data capture and online editing (cleaning of captured data). Editing and coding started on 14 November 2003 and was completed on 31 January 2004. Training of (15) temporary staff used as editors and coders was conducted on 12 and 13 November 2003. Data capture was done seven (7) officers from 15 December 2003 to 27 February 2004. Online editing started on 12 April to 17 September 2004, and was carried out by two officers from Central Statistics Office (CSO) and Department of Non-Formal Education (DNFE)

### 2.9 Response Rates

A total of 7,280 households were selected for the Botswana Literacy Survey (Table 1). Of these, 6.860 were successfully interviewed with a response rate of 94.23 percent. The response rate was highest in urban villages ( 94.78 percent) followed by rural ( 94.23 percent) and towns had the lowest ( 93.62 percent). In the interviewed households, 2,886 eligible persons aged 10-70 years were identified. Of these, 2,613 were successfully interviewed, yielding a response rate of 90.54 percent.

### 2.10 Age Distribution and Missing Data

Figure 1: Single year age distribution of the household population by sex, Botswana, 2001

As shown in Table 2, the single year age distribution of household members by sex exhibits some distortions centred about age 9 and 71 for both females and males. For both sexes, some digit preference is evident for ages ending in 0 and 5 , a pattern typical of populations in which ages are not always known.

### 2.11 Characteristics of the Household Population

Information on the characteristics of the household population and the survey respondents is provided to assist in the interpretation of the survey findings and to serve as a basic check on the sample implementation.

Table 3 and 4 presents the percent distribution of households in the sample by background characteristics. About 46 percent of the households ( 3000 households) are rural and 55 percent ( 4280 households) are urban. Central district had the largest number of households in the sample ( 31.1 percent). The highest proportion of households had 2-3 members ( 30.6 percent) followed by those with $4-5$ members ( 23.8 percent). Children aged below the age of 14 years were found in about 57.8 percent of the households, where as, in about 98 percent of the households at least one individual aged 10-70 years was found. Children under the age of five years were found in about 32 percent of the households.

Table 5 shows the characteristics of eligible persons aged 10-70 years. The highest proportion of eligible individuals were those aged 45-49 years ( 12.5 percent), followed by those aged $50-54$ and $40-44$ years ( 11.6 percent) and then those aged $25-29$ years (12.3 percent). This percentage generally increases with age. The highest proportion of persons in the sample is never married (38.8). Women constitute about 53 percent of the sample of population.

### 3.0 SURVEY RESULTS

## SECTION A: ADULT LITERACY

### 3.1 Population Distribution

The total population estimated from the survey was 1, 850,360 (Table 1). The 2003 population projections (using cohort component method with annual growth rate of $2.4 \%$ ) gave a total population of $1,721,203$. The survey showed a lower male proportion of $47 \%$ compared to the $48 \%$ in the 2001 census. While the general pattern was that there were slightly more women than men in most districts and towns, 6 of 27 localities were estimated to have more men than women. See Appendix A, Tables 1 to 4 . Two of the localities (Orapa and Sowa Town) are towns whose main industrial activities is mining, hence the higher proportion of men.

### 3.2 Botswana Adult Literacy Measures

The first national survey on literacy in Botswana was carried out in 1993. The policy is that literacy surveys should be conducted every 10 years, when new National Population Census data is available. Hence, the Botswana 2003 National Household Literacy Survey is the second attempt to estimate literacy rates through direct and indirect measures. In discussing results, the 2003 National Household Literacy Survey results are compared with results from the 1993 National Household Literacy Survey, estimated adult literacy rates from the 1981, 1991 and 2001 census results, as well as the UNESCO adult literacy estimates.

Due to conceptual problems in defining literacy and difficulties in measuring it operationally, the 1981, 1991 and 2001 censuses did not attempt to estimate literacy rates through direct measures. The census estimates did not therefore include the population with less than five years of education who have acquired literacy through other means. Also, the term adult was defined differently in the census and the UNESCO literacy estimates.

The 1981 census defined an adult as a person 10 years and above and therefore estimated literacy rates using indirect measures among all Batswana citizens of the defined age group. In the 1991 census and the 1993 literacy survey an adult was defined as a person aged 15 years and above, hence literacy rates were estimated among citizens of this age group. When indirect measures were used, all those who had five years of basic education were assumed to be literate. In the 2003 survey, adult literacy rates were estimated from the population of those 10 years and above, 12 years and above and 15 years and above. The 10 years and above category was used because the National Literacy Program targets them. The primary school admission policy requires a child to be less than 10 years when they apply to begin primary school. Those who are not in school by the time they are 10 years are therefore expected to enrol in the National Literacy Program thus they fall into the category of adults. Literacy rate estimates for the 12 years and 15 years and above age categories were reported for purposes of making comparisons with data from censuses, the 1993 survey and the UNESCO estimates. UNESCO defines an adult as a person 15 years and above.

### 3.2.1 Policy Environment

In 1981, the National Literacy Program was set up with the main objective to eradicate illiteracy. In the last ten years, Botswana's target was to increase adult literacy to $90 \%$.

Today Botswana's development is guided by the eight millennium goals (Republic of Botswana 2000). One of Botswana's millennium goals is to ensure that indicators of development such as education are accessible to all. Complementing this goal, Vision 2016 (Republic of Botswana: 2000:) states that:

No citizen of Botswana will be disadvantaged as a result of gender, age, religion or creed, colour, nationality or ethnic origin, location, language or political opinion. The future Botswana will have eradicated negative social attitudes towards the status and role of women, the youth, the elderly, and the disabled...
Throughout this report, findings are disaggregated by location, gender and age to guide efficient policy making and implementation.

### 3.2.2 Adult Literacy Rates

Table 5 presents a trend analysis of literacy rates from 1981 to 2003. The analysis shows that literacy rates for adults 15 years and above increased from $68.9 \%$ in 1993 to $81.2 \%$ in 2003, an increase of $12 \%$ in 10 years. Botswana's goal was to increase the national adult literacy rate from $68.9 \%$ in 1993 to $90 \%$ by 2003. If the literacy rates continue to increase by $12 \%$ every ten years, Botswana is likely to have a literacy rate of about $93 \%$ in 2013.

Figure 2: Trends in Literacy Rates 1991 - 2003

Table 5a compares literacy rates in selected SADC countries. A comparison of Botswana with other SADC countries shows Botswana trailing behind Zimbabwe with an adult literacy rate of $90 \%$, South Africa with $86 \%$ and Namibia with $83.3 \%$, Botswana compares favourably with Lesotho, Swaziland and Zambia. Mozambique has the lowest literacy rate of $46.5 \%$. See Figure 3 for illustration.

Figure 3: Literacy Rates for SADC Countries 2003

### 3.3 Age Specific Adult Literacy Rates

Table 6a and 6b in Appendix A present literacy rates for the 10-70 and the 12-70 year age group respectively. The survey results indicated a national literacy rate of $76.6 \%$ for adults from 10 to 70 years old and $80.9 \%$ for the 12 to 70 year age group, which is almost the same as that of the 15 to 70 year age group. A plausible explanation for the low average literacy rates in the 10 to 70 year age group is that some 10 year olds could still be in lower classes in that although the official age for beginning school is 6 years, those in the predominantly rural areas are most likely to begin school when they are seven years or older.

The age specific literacy rates (Tables $6 \mathrm{a}, 6 \mathrm{~b}$ and 6 c in Appendix A) show further that the population between 15 and 39 years of age had literacy rates of more than $80 \%$. The age groups 15-24 years have the highest literacy rate of $94 \%$ followed by the 25-29 year age group with a literacy rate of $93 \%$. Literacy rates decreased with an increase in age to the lowest of $18 \%$ for those at the age of 70 years. Women of ages between 15 and 44 had higher literacy rates than men in the same age group. Literacy for these age groups ranged between $72.8 \%$ and $94.9 \%$ for women and $68.9 \%$ and $92.5 \%$ for men. For the age group between 45 and 70 years men had higher literacy rates than women in the same age group. Figure 4 shows age specific adult literacy rates by sex for Batswana aged $15-70$ years.

Figure 4: Age specific literacy rates for 15-70 age group by sex

### 3.4 District Adult Literacy Rates

Tables 7a, 7b and 7c in Appendix A show district adult literacy rates for the 10-70, 12-70 and 15-70 year age groups. Tables $7 \mathrm{a}, 7 \mathrm{~b}$ and 7 c indicate high literacy rates in towns for all age groups. In towns, adult literacy rates range between $92.5 \%$ and $98 \%$ for the 15 to 70 year age group. Orapa with a literacy rate of $98 \%$ for the 15 to 70 year age group has almost achieved $100 \%$ literacy. A comparison of literacy rates obtained from the 1993 survey with that from the 2003 survey indicates that literacy in the towns increased by more than $10 \%$.

Kweneng West had the lowest literacy rate of $57.7 \%$ for the 15 to 70 year age group. Ghanzi followed with literacy rates of $59.9 \%$. A comparison of literacy rates in Ghanzi obtained from the 1993 survey with that from the 2003 survey show that literacy rates for the 15 to 70 year age group increased from $56.1 \%$ in 1993 to $59.9 \%$ in 2003. Literacy rates increased by only about $4 \%$ compared to increases of more than $10 \%$ in towns and the nation as a whole. Additional districts with literacy rates below the 1993 national literacy rate of $68.9 \%$ were Ngamiland West ( $65.7 \%$ ) and Kgalagadi South ( $64.9 \%$ ). There are also wide disparities of literacy attainment between urban and rural areas. Table 7 d shows that the urban areas had a literacy rate of $85.4 \%$ against $65.7 \%$ in the rural areas

### 3.4.1 Gender differences

Tables 7a, 7b, and 7c in Appendix A indicate also that literacy rates across all the age groups are higher for females than males in all the districts except North East, Ngamiland East, Ghanzi, Kweneng West and Chobe. The 1993 survey showed Ghanzi and North East with lower female literacy rates compared to males. The 1993 literacy rate differences between males and females were highest in Lobatse, where the literacy rates were 86.9\% for females and $81.3 \%$ for males. It is interesting to note that gender differences in literacy
rates have narrowed to within 3 or less percentage points in all the towns. It should be expected that as towns move close to achieving $100 \%$ literacy rates, there will be no difference between males and females.

In the rest of the districts, gender differences in literacy range between $0 \%$ (no difference) and $10 \%$ compared to a range of between $1 \%$ and $13 \%$ in the 1993 Survey. In the 1993 Survey, there was no district where males and females literacy rates were equal. The survey showed that the largest literacy gap between males and females was found in Kgatleng, where female literacy rates were higher than males by almost $10 \%$. This is followed by Ghanzi where literacy rates were higher for males by $8 \%$ and Kgalagadi West where literacy rates were higher by $7 \%$ in favour of females. Districts with higher gender differences in literacy rates need urgent attention.

### 3.5 Literate Population

Table 8 in Appendix A shows the literate population in Botswana by age, district and sex. The data indicates that the largest proportion of literate people was in the 15-19 year age group. The data shows that by the time the individual reaches the age range 15-19 years, the majority of them would be literate.

## SECTION B: POPULATION THAT NEVER ATTENDED SCHOOL

### 3.6 Population Population aged 10 years and Over Who Never Attended Formal School

One of the objectives of the Revised National Policy on Education (1994) was to enact legislation on compulsory education so that every child attends school. This legislation has still not been enacted and there are primary school age going children who are not in school. One of the main objectives in NDP 9 is to develop an Out of School Education Program. The survey sought to establish the number of children 10-14 who are not in school and to determine the size of the population 10 years and above who never attended formal school and non-formal school or left school before completing Standard 5.

Table 9 in Appendix A shows the population 10 years and above who never attended school. The 2001 census indicated that $15 \%$ of those 10 years and above never attended school. The 2003 literacy survey estimates the number to be $10.5 \%$. The number of people who never attended school seems to be declining.

### 3.6.1 Population aged 10 years and Over Who Never Attended School by District

Table 10 (See Appendix A) shows that Kweneng West had the highest rate (38.5\%) of the population that never attended formal school. Ghanzi followed with $27.1 \%$, Kgalagadi North, $23.73 \%$ and Central Boteti $24.8 \%$. These districts also had the lowest literacy rates. The towns had the lowest rates of those aged 10 years and above who never attended school. The percentage district specific population of those who never attended school range between $1.2 \%$ and $4.3 \%$ compared to a range of $8.9 \%$ and $38.51 \%$ in the other remaining districts.

### 3.6.2 Population aged 10 Years and Over Who Never Attended School By Age

School attendance also differs according to age. Table 11 in Appendix A shows that about $1 \%$ of 10-11 year olds never attended formal school. These are the children that would be
targeted by the Out of School Education Programme. Further analysis reveals that the percentage of those who never attended formal school increased with age. The percentage rose from $13.7 \%$ for the $35-39$ year age group to the highest rate of $66.7 \%$ for senior citizens aged 70 years and above. See figure 5. Generally, the number of people who never attended formal school is declining. In the 1993 survey, age specific proportions beginning with those 12 years old who never attended formal school ranged between $2.1 \%$ and $67.6 \%$. The 2003 survey reported a range of between $1.2 \%$ and $66.7 \%$.

Figure 5: Population aged 10 years and over who never attended formal, by age group-2003

### 3.6.3 Reasons for Never Attending School

Universal achievement of 10 years of basic education has been a goal of the Government of Botswana. However, education is not compulsory. Consequently it has not been possible to protect every child's right to education. Children do not enrol in school for a variety of reasons. Table 12a (See Appendix A) shows the main reasons given for never attending formal school. Figure 3 compares respondents' reasons for never attending school in 1993 with reasons given in the 2003 literacy survey. Table 12 a shows that the most frequent ( $38.1 \%$ ) reason given for never attending school in the 2003 survey was that parents were unwilling followed by looking after cattle: ( $35.8 \%$ ). See figure 6 . There were more parents unwilling to send their children to school in the 2003 survey, $38.1 \%$ compared to $21.8 \%$ in the 1993 survey. In order to find out if there were those who could not access education because of disabilities, respondents were asked to indicate if disabilities (specifically visual problems, physical disability, hearing problems, speech impairment and mental retardation)
were possible reasons for not attending school. About $1 \%$ of the people cited disabilities as a reason for not enrolling in school. During NDP 9, Government will increase access and equity to education and training for learners with disabilities. Statistics on the learners with disabilities who cannot attend school will serve as a base line data to monitor access and equity in education for those with disabilities.

Figure 6: Major resons for not attending school

### 3.6.4 Gender Differences

There were slightly more females who never attended school because of parents' unwillingness ( $68.4 \%$ ) compared to males ( $31.6 \%$ ). A larger proportion of males ( $66.8 \%$ ) were more likely not to attend school because they headed cattle or worked at the lands compared to $33.2 \%$ females. More females than males were more likely not to attend school because they had to perform home chores such as taking care of ill family members and helping at home.

### 3.7 Population 10 Years and Over Who Never Attended School

The 1993 National Literacy Survey established the population 12 years and above who never attended school. There was no data on those who never attended both formal and nonformal school. In the 2003 survey, information was sought on the population 10 years and above who never attended both formal and non-formal school. Data in Table 13 indicate that $10.7 \%$ of the eligible population never attended both formal and non-formal school.

### 3.7.1 Never Attended Both Formal and Non-Formal School by District \& Sex

Table 14 (See Appendix A) indicates that Kweneng West had the highest (29.6\%) district specific population of people who never attended both formal and non-formal school followed by Ghanzi at $23.9 \%$, Central Boteti with $19.1 \%$, and Kgalagadi North and Kgalagadi South with $16.9 \%$ each.

### 3.7.2 Never Attended Both Formal and Non-Formal School By Age Group and Sex

There are people aged 10 years and over who never attended both formal and non-formal schools in Botswana, in spite of government effort to improve access to education
opportunities. Table 15 in Appendix A reveals that about $1 \%$ of children who are 10 to 11 years old are also not attending non-formal schools. There is a steady increase in the number of people who never attended both formal and non-formal schools from $9.6 \%$ in the $35-39$ age group to $62.1 \%$ at the age of 70 years and above. See figure 7. The $70+$ age group form almost one third ( $32.5 \%$ ) of the national proportion of the population that never attended both formal and non-formal school. The majority of those who never attended formal and non-formal school in the 10 to 65 year age range are males.

Figure 7: Population aged 10 years and over that never attended both formal and non-formal school, by age group and sex - 2003

3.7.3 Major Reasons For Never Attending Both Formal And Non-Formal Schools By Sex

Table 16 (See Appendix A) indicates that the main reason for never attending both formal and non-formal school were 'lack of time; (21.8\%), 'looking after cattle'(21.1\%), 'no facilities' ( $9.9 \%$ ), and 'parents not interested' ( $8.5 \%$ ), and 'did not know it existed' ( $7.3 \%$ ). Most females compared to males were more likely not to attend both formal and non-formal school because of home chores such as taking care of ill family members, taking care of family members, and cultural beliefs. See figure 8.

Figure 8: Major reason for never attending both formal and non-formal school, by sex -2003

## SECTION C: POPULATION THAT DID NOT COMPLETE STANDARD 5

### 3.7.4 Population Who Left School Before Completing Standard 5:1993-2003

The target population for literacy programmes include those who left school before they completed Standard 5. Table 17 shows a trend analysis of those who left school before they completed Standard 5. The data shows the proportion of the population of those 12 years and above decreasing from $12.4 \%$ in 1981 to $7.3 \%$ in 1993. In the 2003 Survey $5.3 \%$. of those 12 years and above who left school before completing Standard 5. Females had the highest number of non-completers in 1991, 1993 as well as 2003.

### 3.7.5 Population Who Left School Before Completing Standard 5 By District and Sex

 An analysis by district (Table 18 in Appendix A) indicates that Ghanzi had the highest district specific proportion (9.5\%), of those who left school before they completed Standard 5, followed by Ngamiland West with $8.4 \%$ and Kgalagadi South with $7.9 \%$. These districts also had some of the lowest literacy rates and high district specific proportions of those who never attended both formal and non-formal school.3.7.6 Population Who Left School Before Completing Standard 5 By Age Group and Sex The age specific distribution (Table 19 in Appendix A) show that the proportions of non completers increased with age. The age specific distribution shows increasing proportions of those who left school before completing Standard 5, ranging from $11.3 \%$ at age group $50-54$ to $21 \%$ for the age group $65-69$ years. About $4 \%$ of those $10-19$ years old left school before they completed Standard 5. The majority of those who left before they completed Standard 5 in the 10-11 year age group are females. Males are in the majority among those aged 12 to 34 years. Females form the majority of the non-completers among those aged 35 years and above. Figure 9 illustrates the results.

Figure 9: Population 10 years and over that left school before completing Std 5, by age group and sex - 2003

### 3.8 Major Reasons for Leaving School Before Completing Standard 5

Table 20a (See Appendix A) indicates that the main reasons for leaving school before completing Standard 5 were: "lost interest " (16.8\%), "lack of money" (16.3\%), "looking after cattle or working in the lands" ( $16 \%$ ) and "taking care of ill family members" $11.1 \%$. More females than males were most likely to leave school before they complete Standard 5 because of lack of money ( $71.9 \%$ ), taking care of ill family members ( $76.9 \%$ ). Males were more likely to leave school before completing Standard 5 because of looking after cattle or working in the lands ( $55.9 \%$ ). Loss of interest in school, lack of money and looking after cattle or working in the lands were also given as the main reasons for not completing Standard 5 in the 1993 Survey. An emerging reason for not completing is taking care of ill family members. Figure 10 illustrates the results.

Figure 10: Population aged 10-70 years that left school, by major reason for leaving - 2003

3.8.1 Respondents Main Reason for Leaving School By Age Group And Sex

Table 78 (See Appendix A) reveals that respondents 45-59 age groups were more likely to have left school before completing Standard 5 because of lack of money, looking after cattle or working at the lands, taking care of ill family members or lack of interest. Loss of interest and ill health were the most common reasons given for not completing Standard 5 by those in the 10 to 19 year age group.

### 3.8.2 Period Elapsed since Leaving School Before Completing Standard 5

Table 21(See Appendix A) provides data on the period elapsed since respondents left school before completing Standard 5. It shows that the majority ( $48.6 \%$ ) of those in the 10 11 year age group were away from school for less than one year. The majority ( $51.7 \%$ ) of those in the 12-14 year age group left school 3 to 4 years ago. For those 20 years and above, more than five years had elapsed since they left school before completing Standard 5. More females, $94.6 \%$ were away from school for more that five years compared to $90.2 \%$ for males.

### 3.8.3 Reasons for Leaving Formal School Within 4 years Prior to the Survey

Table 22 in Appendix A provides data on the most frequent reason given by respondents for leaving school before completing Standard 5 during the four years prior to the survey. The main reasons were, 'lost interest' ( $16.8 \%$ ); 'lack of money' ( $16.2 \%$ ); 'looking after cattle/working at the lands' $(16.0 \%)$ and 'ill health' ( $11.1 \%$. These were also the four main reasons given in the 1993 survey.

### 3.8.4 Population Never Attended or Left School By School Attainment, Age Group and Sex

Table 23 in Appendix A indicates the population 5 years and above who never attended or left school before Standard 5 by district, school attainment, age group and sex. In almost all the districts, the highest number of those who never attended school were in the 5-9 year age group. The 5-9 year age group includes children who cannot start school in government
institutions where the official age for beginning school is six years. The $10-14$ year age group has the smallest number of people who never attended or left school before Standard 5 in all the districts. This would seem to suggest that the majority of the children 10 to 14 years are in school, thus confirming the view that Botswana has achieved universal seven years of basic education predominantly accessed by those 6 to 14 years.

### 3.8.5 Population Aged 5 Years and Over Who Left School by Educational Level Completed and Sex

During the National Development Plan 8 (1997-2003) the Government continued its efforts to offer educational services to its citizens to enable them to engage in useful and productive lives in order to satisfy the human development needs of the nation. The state made some of these efforts to reduce inequalities, within the limits of the available resources. Educational achievements can also be determined from census data, which seeks data on the populations' educational attainments. Statistic on current educational enrolments and attainment levels is available through annual Educational Statistics Reports, the current reports will therefore not dwell much on this issue. Table 24 shows population 5 years and over that left school by educational level and sex. The findings are summarised below.

Primary School Level (Std5-7): Data revealed that the population that left primary school after completing Standard 5-7 levels was $26.7 \%$ compared to $54.6 \%$ during 1993.This could be because more people are moving to Form One because of free education. The majority of those who left school were in Standard Seven 62.2\% compared to 61.7\% in 1993. The majority of them (57.4\%) were females.

Secondary Schools Level: The population of those who left school at secondary level increased from $42.2 \%$ in 1993 to $49.9 \%$ for 2003. The highest proportion (54.7\%) of those who left secondary school in 2003 were in junior secondary schooling.

Tertiary Education Level: The rather dramatic increase in the proportion of the population with tertiary education from $2 \%$ in 1993 to $23.4 \%$ in 2003 can be attributed to the difference in the definition and classification of tertiary education during the two surveys. While the 1993 survey missed some tertiary education qualifications, the 2003 survey included all of them. The highest proportion of those who left tertiary education with a qualification in 2003 was for those who completed Certificates, with $43.1 \%$ of them being females.

### 3.8.6 Age Distribution of Population Who Left School by Educational Attainmentand and Age

Table 25 in Appendix A shows that the 20-24 year age group formed the highest proportion (20.1\%) of those who had either completed Primary, Secondary or Tertiary education. The second highest proportion (18.8\%) was that of the 25-29 year age group followed by the 3034 year age group at $14.6 \%$.

## SECTION D: PARTICIPATION IN ADULT LITERACY PROGRAMS

### 3.9 Enrolment in Adult Literacy Programmes

Botswana remain committed to eradicating illiteracy during NDP 9, the National Literacy Program will be transformed into three out of school programs as follows:

- Adult Basic Education
- Post Literacy and Life Skills
- Out of School Education for Children.

The survey sought to establish the number of people enrolled in the literacy program, retention, drop out and completion rates. Table 26 indicates that a total of 185,236 persons were eligible for literacy classes. Of the total number that was eligible, only $38.5 \%$ enrolled in the literacy programme. $71.5 \%$ of the eligible population has never attended literacy classes. During the 1993 survey about $81 \%$ of the eligible population had never attended literacy classes. The 2003 survey thus show a drop of almost $10 \%$ in the population that never attended literacy classes. More males ( $80.6 \%$ ) than females never attended the literacy classes. Moreover, there are more females (8.7\%) than males ( $2 \%$ ) still attending classes. See figure 11.

## Figure 11: Enrolment in Adult Literacy Programs

### 3.9.1 Participation in Literacy Classes by Age

A total of 5,371 children aged 10-14 had not attended both formal and non-formal or had left school before they completed Standard 5. One of the objectives of the survey was to establish their participation in the literacy programme. Table 26a in Appendix A shows participation in the literacy program by age. Data shows that only 35 of the children 10-14 were still attending while 259 dropped out of the programme.

### 3.9.2 Reason for Never Attending Literacy Classes By Sex

It is important for policy makers to know why $71.5 \%$ of the population eligible for the literacy program do not enrol. Table 27 in Appendix A shows that the two most frequently cited reasons for not attending literacy classes were that the eligible respondents were 'not interested' $(24.1 \%)$ and 'lack of time' $(20 \%)$. These were also the most frequently cited reasons given in the 1993 survey. This would seem to suggest that the attitude of the people towards the literacy programme has not changed. Other reasons that were common are 'no facilities' ( $8.5 \%$ ), 'parents not interested' ( $6.7 \%$ ) and 'did not know it existed' (6.4\%). Disabilities taken together were cited as a reason for not attending literacy programmes by about $3.5 \%$ of the eligible population.

### 3.10 Access To Adult Literacy Programmes

It is clear from the reasons given that some proportion of the eligible population could not access literacy programs because there were no facilities in the area, distance problems, disabilities and lack of information on the programme. These emerge as possible
determinants of accessibility to the eligible population that have implication for policy and planning. Table 28 shows the type of literacy programs available to the eligible population. The table indicates that the most popular programme is the National Literacy Programme attended by $92.4 \%$ of the learners. See figure 12.

Figure 12: Type of Literacy Class Programmes By Number of Learners and Sex

### 3.10.1 Attending Literacy Classes By Period of Attendance

The National Literacy Programme does not have a stipulated amount of time that participants must take to complete each primer. The survey sought to estimate the amount of time that participants take to complete each primer. Table 30 shows attendance of literacy classes by period of attendance, primer level and sex. It indicates that the majority of learners $(21.8 \%)$ are in Primer Two followed by those who have not completed Primer One at $21.5 \%$. The majority ( $95.7 \%$ ) of the participants took less than one to two years to complete Primer One. $84.6 \%$ of those who had not completed Primer One had only been enrolled for less than a year. In comparison, it took the majority ( $73.8 \%$ ) of those who had completed Primer Five one year to more than two years. However, all participants enrolled in English as a Second Language completed it in one to two years.

### 3.10. 2 Reasons for Missing Literacy Classes by Sex -2003

Once enrolled in literacy classes, adults are most likely to be absent for a variety of reasons. Table 31 in Appendix A presents reasons for missing literacy classes. The data indicates that ill health ranked as number one reason for missing classes ( $16.8 \%$ ). This was followed by no instructor/ teacher ( $15.3 \%$ ), taking care of ill family members and job demands ( $12.5 \%$ ). Gender differences in the reasons for missing literacy classes were observed in two areas, namely, ill-health and job demands. There were no males who missed classes because of taking care of ill-family members. More males (27.8\%) were more likely to miss classes because of job demands compared to $9.1 \%$ of the females. Figure 13 illustrates the results.

Figure 13: Reasons for missing classes, by sex

3.10.3 Reasons for Leaving Classes by Sex.

Table 26 showed that $22.8 \%$ of the eligible population left the program. Table 31a in the Appendix shows reasons for leaving classes by sex. The data revealed that 'other reasons' (37.1\%) was given as the most frequent reason followed by 'lost interest' (10.5\%), 'ill health,' ( $10.5 \%$ ), and 'looking after cattle and working at the lands' (9.9\%). Only $6.8 \%$ left because they had achieved their goal. This suggests a high drop out rate from the literacy classes. More women than men were likely to leave classes because they had lost interest, taking care of siblings or because of ill health.

### 3.11 Importance of Reading/Writing Skills by Sex -2003

It was important to solicit the views of those who attended literacy classes on the value of reading and writing skills in their contexts. Table 32 in the Appendix reveals the learners’ perception of the importance of getting reading and writing skills in their contexts. It points to the acquisition of 'better communication' skills (23.4\%), 'knowledge's sake' (23.5\%) and 'getting a job' $(19.8 \%)$, as the key reasons for participating in literacy education. These responses may suggest that literacy was not viewed as an end in itself but a means to fulfil their other life needs such as getting a job. It could be argued that some individuals saw it as the gate to getting a job, while those who were already employed probably saw it as an opportunity to advance themselves in their work. See Figure 14

Figure 14: Importance of Reading/Writing Skills by Sex

### 3.12 Reading and its Sources

To better understand the sources of their reading skills, the eligible population aged between 10-70 years who have never been to school or left school before Standard 5 were asked to state where they acquired their reading skills. Table 33a suggests that most people ( $52.2 \%$ ) acquired their reading skills from the formal school system followed by $32.2 \%$ who reported acquired their reading skills from Literacy Programs. Some reported that they acquired reading skills from night schools (3.8\%) and a few learnt reading on their own, (11.8\%). More males than females acquired reading skills on their own.

## SECTION E: LITERACY TESTS

The impact of the literacy programs was not only measured by participation on the program but also by performance of the participants on literacy tests.

### 3.13 Participation in the Tests

Respondents took tests in Setswana and English reading, writing and oral skills and numeracy. More candidates took the Setswana oral test $(183,347)$ followed by those who took the numeracy test $(178,786)$. More people took the tests in this survey compared to the 1993 survey. Figure 15 compares the numbers of test takers in the 2003 Literacy Survey with those in the 1993 Literacy Survey.

## Figure 15: Number of Test Takers by Subject

### 3.14 Determining the Literate Population

The literate population among those with less than five years of education or never attended both formal and non-formal school was determined by computing their mean score in English and Setswana reading, writing and oral tests as well as numeracy. Mean scores for only those who took all the tests were computed. A total of 5,812 out of an eligible population of 185,236 took all the administered tests, i.e., about $3 \%$. Of those who took all the tests, 3,363 passed. A mean score of fifty percent and above was the cut off point for passing or classifying a person as literate. This cut off point was adopted because it is used in the Standard Four attainment tests to decide on those who proceed to Standard 5 who are then defined as literate. Results of the Literacy tests increased the literacy rate by only $1.6 \%$.

To establish if the NLP made a difference to literacy skills, mean scores for those with less than Standard 5 who never attended literacy classes were compared to those who attended. Figure 6 shows that the means for those who attended literacy classes were higher than for those with less than Standard 5 who never attended literacy classes in all the subjects except English Writing. Those with less than Standard 5 who never attended literacy classes had a higher mean score in English Writing than those who attended literacy classes. Figure 16 shows the mean scores of tests administered.

Figure 16: Comparison of mean test scores of those with and those without non-formal education

Impact of the NLP was further measured by comparing percentage passes in the tests administered to those with less than Standard 5 who never attended literacy classes and those who attended. Results show that those who attended literacy classes had high percentage passes than those who never attended literacy classes in all the tests except in English Writing and Reading. About 72\% of those with less than Standard 5 who never attended literacy classes passed the English Writing test compared to about $65 \%$ of those who attended literacy classes. Figure 17 illustrates the results.

Figure 17: Comparison of percentage passes for those with and those without non-formal education

### 3.15 Assessment of Literacy For Program Improvement

In the 1993 Survey, performance on literacy tests was based on a test marked on a pass or fail basis only. Such an approach, though essential for making decisions on classification, awarding certificates or progression from level to another, fails to indicate what the learners are able to do. In this survey, scores were further analyzed on a continuum of scale. The score code ranged from 'no response', 'relevant attempt' to 'correct answer'. The scores in
each of the literacy tests were computed and linearly transformed to a common z-scale. Based on the $z$-scale, participants with a $z$-value of -.60 or less were classified as lacking competence (incompetence) in the skill under consideration. Those with $z$-values ranging from -.60 to +.60 were classified as having some level of competence (some competence) while those with $z$-values of +.60 or above were classified as having high level of competence (high competence) in the literacy skill under consideration.

### 3.16 Self-Proclaimed Literacy and Test performance

This section reports literacy rates determined on the basis of respondents self reports and test scores on Reading and Writing in English and Setswana as well as Numeracy. Most countries in Sub-Saharan Africa estimate literacy rates from respondents' reports on their ability to read or write in the official language and the mother tongue. The Botswana 1993 Literacy Survey used respondents self-proclaimed literacy skills as well as test results to estimate literacy in the population of those with less than ten years of basic education. The Botswana 1993 literacy survey did not show any major differences in what the respondents reported and their performance in the tests. The differences in self-proclamation and test results were smallest in English reading and writing. In this survey, respondents were asked to indicate the levels of reading and writing in English and Setswana that they had. Table 33 b in Appendix A shows the levels of self proclaimed skills in reading and writing by performance level. The data shows that between $20 \%$ and $27 \%$ of those who proclaimed some level of skill in reading and writing in Setswana and English were incompetent in the skills assessed. Respondents demonstrated higher competences in English reading (32.6\%) and English writing ( $35.2 \%$ ) compared to $16.8 \%$ in Setswana reading and $28.3 \%$ in Setswana writing. In all these, females outnumbered males.

### 3.17 Self-Proclaimed Literacy by Language and Test Results in Oral and Numeracy Skills

Prior to giving tests to citizen aged between 10-70 years old who never attended or had dropped out of school before attaining Standard 5, they were asked to indicate whether or not they could read in Setswana and or English. Table 33c in Appendix A, show selfproclaimed literacy in English and Setswana reading, writing and oral skills. The data indicates that $98.6 \%$ of the eligible population claimed they could read in Setswana compared to only $5.6 \%$ in English. It also shows that $79.9 \%$ claimed they could write in Setswana while 71.3\% claimed they could write in English.

Respondents' mean scores were computed in oral and numeracy tests. Respondents were classified as passed if they scored above $50 \%$ and fail if their mean score was below $50 \%$. The data shows that $89.6 \%$ of the respondents passed the Setswana oral test while only $38.8 \%$ passed the English oral test. Also, more females could read, write and numerate than males except for English oral test, where 2,182 males passed compared to 2,088 females.

### 3.18 Self-Proclaimed Literacy in Setswana Reading by district and Sex

Data also depicts a district by district analysis of participants self reports on reading in Setswana. Table 34a in Appendix A indicates that $65.5 \%$ of the eligible population claimed they could read Setswana. The district with the highest number of people who claimed they could read Setswana was Central Serowe/Palapye with (13.0\%). It also revealed that six out of the seven towns had no people who claimed they could not read Setswana. The
highest percentage of individuals who claimed they could not read in Setswana came from Central Tutume $21.5 \%$, followed by Kgalagadi South with $17.4 \%$. It should be noted that most of participants who could not read Setswana lived in places where they spoke languages other than Setswana as a mother tongue. This may have negatively affected their Setswana reading capabilities. Across all districts and towns more females, 38073 (60.2\%) than males claimed they could read Setswana.

### 3.18.1 Self-Proclaimed Literacy in Reading English by district and Sex

Table 34b in Appendix A shows that only 10,340(5.6\%) of the eligible population claimed they could read English. This inability to read in English may suggest a weakness in the teaching of reading English across the different sources of reading skills in Botswana, from formal school to the literacy programme. The data also indicates gender difference among those who claimed they could read English. The table revealed that more females, 38,073 ( $54.5 \%$ ), than males claimed they could read English. In all the 6 towns, more males could read English.

### 3.18.2 Self-Proclaimed Literacy in Setswana Writing by district and Sex

Table 35a in Appendix A reveals that 79.9\% of the eligible population claimed they could write in Setswana. Most people probably prefer to write in Setswana because it is the medium of instruction in the first four years of schooling. Also it is the language used on a daily basis by most people in Botswana. The district with the highest percentage of people who claimed that they could write in Setswana was Central Serowe/Palapye with $14.2 \%$.The highest percentage of respondents who claimed they could not write Setswana came from Central Tutume with $13.2 \%$ followed by Central Mahalapye with $10.1 \%$. In Tutume, most people do not speak Setswana as their mother tongue. More females, $59.1 \%$ compared to males claimed they could write in Setswana. The table also reveals that $25 \%$ of the eligible population did not write Setswana test.

### 3.18.3 Self-Proclaimed Literacy in English Writing by district and Sex

Table 35 b in Appendix A indicates that $4.2 \%$ of the eligible population claimed they could write English. Central Bobonong recorded the highest percentage (15.4\%) of people who claimed they could write English. It was followed by Central Serowe/Palapye with 14.4\%. The data also revealed gender difference among people who claimed that they could read English. The table indicates that more females $52.8 \%$, than males claimed they could read English.

### 3.18.4 Self-Proclaimed Literacy in Setswana Oral Test by district and Sex

A district by district analysis of performance in oral Setswana was undertaken. The respondents' Setswana oral abilities were assessed and the results on table 36b in Appendix A indicate that $74.9 \%$ of the eligible population could answer oral Setswana questions. Across all district and towns respondents could answer questions in Setswana. The district with the highest percentage of people who answered oral Setswana questions was Kweneng East with $10.6 \%$ followed by Ngwaketse which had $8.9 \%$ and Central Serowe/Palapye with $7.1 \%$. It also revealed that of most of the 6 towns had people who did oral Setswana test. The table also shows that $0.7 \%$ of the eligible population did not take Setswana oral test. The highest percentage of respondents who did not take the Setswana oral test came from Kgalagadi South with $42.8 \%$ and followed by Central Tutume with $10.5 \%$. Kgalagadi South and Tutume, have people who mostly speak other languages other than Setswana as their mother tongue. More females, $55 \%$ compared to $45 \%$ for males took Setswana oral test and they did well compared to their male counterparts.

### 3.18.5 Self-Proclaimed Literacy in Oral English by district and Sex

Performance in English oral test was determined among the eligible population. Table 36b in Appendix A shows that $6 \%$ of all respondents in the eligible population claimed they could answer English oral questions. The district which had the highest percentage of respondents who claimed they could answer English oral questions were Kweneng West with 1,760 ( $16 \%$ ) followed by Central Mahalapye with 1,492 (13.5). Most participants, $94 \%$ did not take English oral test. The highest percentage of participants who did not take English oral test came from Central Mahalapye with $11.3 \%$ followed closely by Kweneng West with $10.3 \%$. A gender analysis of performance in English oral test revealed that more males, $(51.8 \%)$ compared to females took the English oral test and did better than females.

## Test Results By Competence Levels

### 3.19 Literacy Test Result Performance, By Subject Scores And Sex

The performance on literacy tests was further measured on a continuum of competences using z scores. Table 38 in Appendix A shows the various competence levels. English writing had the highest percentage of respondents who demonstrated high competence (38.0\%) followed by English writing (34.2\%) and numeracy (28.4\%). The smallest percentage of respondents with high competence were recorded in Setswana oral (.02\%) and English oral test ( $2.4 \%$ ). Results also show that concentration of scores is in the 'some competence' category indicating that competencies are minimal.

### 3.20 Eligible Population Who Failed Numeracy Test By District And Sex

Test results were further analysed on a pass fail bases. Table 39 in Appendix A shows data on those who failed numeracy test by district and sex. District by district analysis indicates that the highest percentage of respondents who failed numeracy was in Central Serowe/Palapye with $11.2 \%$ followed by Kweneng East with $10.4 \%$ and Central Tutume with $10 \%$. The lowest percentage of failures in numeracy were recorded in the mining towns of Orapa and Sowa town. A possible explanation for low failure rates in numeracy in Orapa and Sowa town is that people access numeracy skills from the adult basic education course offered in the mines in these towns. More females than males, (53.4\%) failed the numeracy test.

### 3.21 Eligible Population Who Failed Setswana Reading Test By District And Sex

Data on Table 40a in Appendix A indicates that Central Serowe/Palapye, recorded the highest percentage of people ( $11.1 \%$ ), who failed in Setswana reading followed by Central Tutume with $10.1 \%$. Orapa and Jwaneng recorded no failure in Setswana reading for both males and females.

### 3.22 Eligible Population Who Failed English Reading Test By District And Sex

Almost all towns and cities did not record failures. Francistown, Lobatse, Selibe Pikwe, Orapa, Jwaneng and Sowa town did not record failures in English reading test. Table 40b In Appendix A shows that Gaborone city had the smallest percentage of respondents (2.6\%) who failed English reading test. A possible explanation for this trend is that people in towns and cities have more access to opportunities to learn to read English compared to those in other districts. The highest percentage of respondents who failed English reading
was in Ngamiland West with $11.9 \%$, followed by Central Bobonong with $11 \%$ and Central Tutume with $10.8 \%$. More females than males, (56.3\%) failed English reading test.

### 3.23 Eligible Population Who Failed Setswana Writing By District And Sex

Data on Table 41a in Appendix A indicates that the highest concentration of failures in Setswana written test was in Central Serowe/Palapye with 3,775 (13.4\%). The failure is not withstanding the fact that most of them speak Setswana as their mother tongue. As reported in the 1993 survey, this may indicate that people proficient in speaking Setswana, may have difficulties writing it. The last literacy survey concluded that "the ability to speak the language fully or partially may not determine literacy level" (CSO \& DNFE, 1993:53). In all the districts more females than males failed the Setswana reading test.

### 3.24 Eligible Population Who Failed Writing In English By District And Sex

Table 41b in Appendix A presents a detailed analysis of the eligible population who failed English writing by district and sex. Orapa and Jwaneng recorded no participants who failed the English Writing test. A possible explanation for this trend is that English is used frequently in these contexts. The highest percentage of failures ( $13.4 \%$ ), was recorded in Central Serowe/Palapye, followed by Central Tutume with $9.2 \%$. More females (56.1\%) than males failed the English Writing test. There were, however, variations in gender differences in failure rate by district. More males than females failed the writing test in Ngamiland West, Kweneng East and Central Tutume.

### 3.25 Eligible Population Who Failed Oral Setswana Test By District And Sex

Setswana is both the national language and the medium of instruction in formal and nonformal education programmes in Botswana. Table 42a in Appendix A shows the eligible population who failed oral Setswana test by district and sex. The highest concentration of those who failed Oral Setswana test were recorded in Central Mahalapye (21.6\%), followed by Kweneng East ( $12.8 \%$ ). Sowa, Orapa and Jwaneng had the lowest number of failures. The existence of mine operated adult basic education programmes probably explain lower failure rates in the mining towns of Jwaneng, Orapa and Sowa town. There were more females who failed the oral Setswana test ( $55.2 \%$ ), than males ( $44.8 \%$ ). There were, however, variations in performance by district. There were more males than females who failed Setswana oral tests in Gaborone, Francistown, Lobatse, Kgatleng, Ngamiland West and Kgalagadi South.

### 3.26 Eligible Population Who Failed Oral English Test By District And Sex

English is the official language and is used as a medium of instruction in formal schools after Standard 5. It is taught as a second language in the NLP in Botswana. Table 42b in Appendix A shows the eligible population who failed English oral test by district and sex. The highest failure rates in English oral test were found in Kweneng East with 10.8\% followed by Central Serowe/Palapye ( $10.1 \%$ ) and Central Tutume ( $9.9 \%$ ). Towns recorded the lowest numbers of people who failed English oral test, especially the mining towns of Orapa and Jwaneng. More females (54.7\%) than males (45.3\%) failed English oral test. Variations in performance by district were observed. In Gaborone, Francistown, Kweneng East and Kgatleng, there were more males than females who failed English Oral test. A very high percentage, $50.9 \%$ did not take the Oral English test. The majority of those who
did not take the English Oral test were from Central Serowe/Palapye (11.3\%), followed by Kweneng East ( $10.3 \%$ ), and Central Tutume with ( $10.0 \%$ ).

### 3.27 Competence In Setswana And English Reading, District And Sex

Table 43 in Appendix A focuses on eligible population test results in Setswana and English reading, by district and sex. Performance was measured on the basis of whether there were differences in tests results according to district. Central Tutume recorded the highest number of people $(2,019)$ who were incompetent in Setswana reading followed by urban villages with 1,513 people and Serowe/Palapye with 1,505 . In the English reading test, Kgatleng recorded the highest number of people (363) who were incompetent followed by South East with 350 people. There were variations in the performance of males and females according to district. In Kgalagadi South, all the 76 males who took the English reading test were incompetent while the majority of women showed some competence (121) and high competence (71).

### 3.27.1 Competence In Setswana And English Writing By District And Sex

Data on Table 44 in Appendix A show the eligible population test results in Setswana and English writing, by district and sex. Central Serowe/Palapye had the highest percentage of people who were incompetent in Setswana writing ( $12.0 \%$ ) followed by urban villages with $11.3 \%$, Ngamiland West with $8.5 \%$, Bobonong with $7.2 \%$ and North East with $7.0 \%$. In Chobe, all those who took the English writing test (100\%), demonstrated high competence, while in Kgalagadi North all the 76 people who took the test demonstrated incompetence(100\%). Some districts, Ngamiland East, Central Tutume, and Ngwaketsi East had no people who demonstrated high competence in the English Writing test. There were variations in performance of males and females in the districts. Males failed to demonstrate high competence in Setswana writing in Ngwaketse, Barolong, South East, while females demonstrated high competence in reading in these districts. Males demonstrated high competence in 16 districts while females showed high competence in English writing in only 11 districts.

### 3.27.2 Competence In Setswana And English Oral, By District And Sex

Table 45 in Appendix A indicates eligible population test results in Setswana and English oral, by district and sex. Data shows that there was no district that demonstrated incompetence in the English oral test. A few districts namely Ngamiland East, North East, and Ngwaketse West, Ngwaketsi, Jwaneng, Sowa Town and Selibe Pikwe had no people who demonstrated high competence in the English oral test. In contrast, in the Setswana oral test, all districts recorded people with incompetence except Orapa, Jwaneng and Sowa Town. Males demonstrated high competence in English in 16 districts compared to 12 for females.

### 3.27.3 Competences in Numeracy By District and Sex

Table 46 in Appendix A shows that the highest percentage of people who were incompetent in numeracy was Ngwaketse (12.1\%) followed by Kweneng East, (11.8\%). Sowa Town had the lowest percentage of respondents ( $0.04 \%$ ) followed by Orapa $(0.05 \%)$. These are mining towns with a fairly small population overall and probably people could have been at work during the survey. The highest percentage of respondents came from Kweneng East, ( $10.5 \%$ ), which also had the highest number of people who were incompetent in numeracy.

### 3.27.4 Test Result For the NLP

This section presents results of the performance of respondents who attended non-formal education classes and those who were still attending at the time of the survey. There are five primer levels in the NLP. The survey established if the literacy programme participants could read, write and answer oral tasks in English and Setswana. Numeracy skills were also assessed. In addition to the Setswana primers learners are offered English as second language course. English could be introduced after Primer 5 or as soon as the learners express the desire to learn it. Table 47 in Appendix A shows test results by subject. More people in the NLP took the tests compared to those in the 1993 literacy survey. (See Table 47a).

### 3.27.5 English Reading, Writing and Oral

Table 47 in Appendix A shows performance by subject. There were no clear differences in performance according to primer level in English reading, writing and oral skills. A possible reason for this outcome is that literacy in English is introduced only when participants feel ready. The primer level does not therefore reflect the level of literacy skills in English.

### 3.27.6 Setswana Reading and Writing

Performance in reading and writing Setswana improved with the level of the primer. In Setswana reading, there were more of the candidates in Primer 4 and 5 performing at the level of high competence compared to the lower primers. Performance in Setswana writing was lower than that in Setswana reading with very few candidates performing at the level of high competence. The majority of those in Primer 4 and 5 performed at the level of 'some competence'. There were however, no differences according to primer level in the Setswana oral test. More than half the candidates at each primer level passed at the level of high competence.

### 3.27.7 Numeracy

More than half of those in Primer 4 and 5 passed at the level of high competence while between 780 and 3,149 candidates in the lower primers revealed no competence in numeracy.

### 3.28 Test Results: NLP By Age Group And Sex

Table 48 in Appendix A shows that a total of 40,691 candidates who took the tests had not attended NLP with 19,586 ( $48.1 \%$ ) being male and 21,305 ( $51.9 \%$ ) female. There were equal number of candidates for each of the seven tests with males and female participation in the same proportions as for the total candidature.

### 3.28.1 English Reading Test by Age and Sex

In the English reading test, there were more people (19.8\%) with high competency in the age group $45-49$ with more of them being male ( $58.7 \%$ ). There were no people with high competency in the 10-14 year age group.

### 3.28.2 English Writing Test by Age and Sex

In the English writing test, there were more people (19.7\%) with high competency in the age group $55-59$ with more of these being females (79.8\%). There were less people with high competency in the 10-29 years age groups. The English oral test had more (26.3\%)
high competent candidates in the age group 65-69 with more of these being males (53.5\%). There were no people with high competency in the age group 10-11 years.

### 3.28.3 Setswana Reading and Writing Test by Age and Sex

Setswana reading test had more people ( $15.2 \%$ ) with high competence in the age group 4549 with more being male ( $56.3 \%$ ). There were no people with high competency in the 10-24 age groups. In the Setswana writing test, there were more people (15.7\%) with high competence in the age group 40-44 with more being male ( $54.9 \%$ ). There were less people with high competency in the age group 35-39. In the Setswana oral test, there were more people ( $20.6 \%$ ) with high competency in the age group $55-59$ with more being females ( $80.7 \%$ ). There were less high competent people in the age group 15-19.

### 3.28.4 Numeracy Tests by Age and Sex

The numeracy test had more people ( $18.2 \%$ ) in the high competence category in the age group 65-69 with more being male $55.3 \%$ ). There were no people with high competence in the age group 25-29 years.

### 3.28.5 Test Results of Eligible Population by Attainment and Sex

There are multiple sources of learning opportunities. Table 49 compares test results of those who never attended literacy classes or never attended formal school, with those who did not complete Standard 1 and those who attained Standard 1 to 4. Candidates were assessed in English reading and writing, Setswana reading, writing and in numeracy. The number of candidates who took the tests were almost equal for each of the tests $(4,232)$.

### 3.28.6 English Reading and Writing

In English reading, more than half ( $74.4 \%$ ) of those who never attended school but were self-taught were in the high competence category. Also, more than half those who took the test with Standard Three (54.0\%) and Standard Four (49.3\%) attainment were in the high competence category. In English writing, more than half (74.4\%) of those who never attended school and those with Standard Four attainment (54.5\%) were in the high competence category.

### 3.28.7 Setswana Reading and Writing

In Setswana Reading, more than half (63.2\%) of those who never attended school and those with Standard Four attainment (90.9\%) were in the high competence category. In Setswana Writing, more than half of those who never attended school and those with Standard Two, Three and Four attainment were in the high competence category.

### 3.28.8 Oral Tests

Performance on the English Oral test improved with level of attainment. Those who completed Standard 3 and 4 performed better than those in the lower grades and those who were self taught. Performance on the Setswana Oral test was more or less the same across all levels of attainment. All the candidates performed at the level of 'some competence' or 'high competence'.

### 3.28.9 Numeracy Test

Performance was more or less the same across all levels. Scores were clustered around the 'some competence' and the 'high competence' performance levels.

## SECTION F: LITERACY SKILLS

### 3.29 Use of Literacy Skills

The Botswana Government has made several efforts to create a literate environment for those who have acquired reading and writing skills. The questions on materials read and the types of things the eligible population wrote in their daily lives may be a crucial ingredient of creating and sustaining a literate environment and learning on a lifelong basis as envisaged in the 1994 Revised National Policy on Education. In order to achieve the goal of creating a literate environment, the Department of Non-Formal Education and the Botswana National Library Service collaborated to establish Village Reading Rooms (VRRs) to provide neo-literates with post-literacy and other supplementary reading materials. Based on this goal participants were asked to indicate the materials they read and the types of written activities they engaged in during their daily lives.

### 3.29.1 Eligible Population By Type Of Material Read And Sex

Table 52 in Appendix A shows a summary of the type of material read in Setswana and in English. There were more people reading Setswana materials $(62,4900)$, compared to English $(8,337)$. Those who read Setswana materials were mostly likely to read religious books ( $33.9 \%$ ) while those who read English are most likely to read newspapers. The second most common Setswana materials read are news papers (22.4\%), mostly read by males ( $35.4 \%$ ). The least read Setswana material are novels. In English reading, a large proportion of people ( $29.0 \%$ ) reported having nothing to read as shown in Figure 18.

Figure 18: Eligible population who could read, by language, type of material, and sex

### 3.29.2 Eligible Population by Type of Work Written and Sex

An analysis of the type of material written is in Table 53 in Appendix A. In Setswana writing, most people wrote letters ( $44.2 \%$ ). However, there is a considerable number who reported having nothing to write ( $32.4 \%$ ). There were gender differences in the writing of letters and reports on having nothing to write. Though writing work related materials was among the least popular written materials (7.5\%), it has to be noted that this form of writing is mostly reported by males (14\%) compared to females (3\%). In writing English, most people reported having nothing to write ( $41.8 \%$ ). Writing of letters ranked second ( $24.8 \%$ ) while writing of work related materials ranked third, again, with males recording more of this kind of writing ( $30.9 \%$ ) compared to $11.3 \%$ of females. Figure 19 compares type of work written by language.

Figure 19: Eligible population that could write by type of work written and sex

### 3.29.3 Eligible population by language, reason for never reading and sex

Reasons for never reading in Setswana or in English are shown in Table 54 in Appendix A. In Setswana, the most popular reason reported was that they did not have anything to read (35.7\%) and this was reported mostly by females (41.0\%). It should be noted that poor eyesight was also reported as a second highly contributing factor for not being able to read ( $25.8 \%$ ) with females being the most affected ( $31.6 \%$ ) in comparison to $16 \%$ of males. Lack of interest in reading Setswana was the least reported reason (2.5\%).

In English reading, as in the Setswana reading, the majority reported having nothing to read as a contributing factor (34.9\%). The second popular reason for not reading in English was given as not being able to read well (28.0\%). Figure 20 shows reasons for never reading by langauage.

Figure 20: Eligible population by language and reason for never reading

### 3.29.4 Eligible Population By Language, Reason For Never Writing and Sex -2003

Table 55 in Appendix A shows participants reasons for never writing. In Setswana writing, $57.4 \%$ of the participants did not write anything because they had nothing to write. The majority of them were females (59.4\%). In English language, however, $56.7 \%$ had nothing to write because they could not write. The majority who had nothing to write were males $(60.5 \%)$. Inability to write and lack of something to write about were therefore major factors for never writing in these languages. Figure 21 shows reasons for never writing by language.
Figure 21: Population that never writes English or Setswana, by reason for never writing

### 3.29.5 Eligible Population by Language, and Future Reading Plans

Table 56 in Appendix A shows population who could not read by language, future reading plan and sex. A very small number of people (688) reported they could not read in Setswana compared to a very large number $(104,036)$ who could not read in English. In Setswana reading, the majority of participants plan to enroll in the National Literacy classes (82.7\%). In English again, plans to enroll in the planned National Literacy classes rank highest ( $70.5 \%$ ). Plans to enroll in the workplace literacy programmes were the least popular in both languages with only $7.8 \%$ enrolling in Setswana and $4.4 \%$ in English reading lessons. This shows that people were aware of the National Literacy programme and were willing to enrol in it. A considerable percentage of participants reported having no plans to read in English (23. 6\%) and this was fairly distributed among the sexes (22.8\% males and $24.3 \%$ females). Figure 22 shows population who could not read by language and future reading plan.
Figure22: Eligible population who could read, by language, future reading and sex

### 3.29.6 Eligible population who wish to take Setswana and English Lessons

The use of Setswana and English for personal and official communication purposes makes it necessary for participants to want to learn it. Both languages are also important in enabling participants to cope with their daily life activities such as completing forms, reading instructions on medicines and receiving instruction at work. The survey intended to establish the extent of the need for Setswana and English in various aspects of the participants' lives. Table 57 in Appendix A shows that $68.4 \%$ of the participants who did not know Setswana wanted to learn it. More males ( $69.7 \%$ ) showed a greater demand for Setwana than females. In comparison, $60.1 \%$ of the participants who did not know English wanted to learn it, with the highest demand expressed by males ( $61.2 \%$ ). Figure 23 shows eligible population who wished to take Setswana and English Lessons.

Figure23: Eligible Population who wish to take Setswana and English lessons

### 3.29.7 Reasons For Not Willing To Learn Setswana

Data in Table 59 indicates that several reasons were furnished for not willing to learn Setswana. Some participants cited being 'too old' (29.4\%) as the main reason for not willing to learn Setswana. This was followed by $26.3 \%$ who cited 'poor eye sight' as the reason for not willing to learn Setswana. However, there were those who expressed 'lack of interest' ( $23.3 \%$ ) as the reason for not learning Setswana. These were mostly females $27.7 \%$ compared to $19.6 \%$ for males. 'Lack of time' was also noted as a reason for unwillingness to learn Setswana. Figure 24 shows reasons for not willing to learn Setswana by sex.

Figure24: Reasons for not willing to learn Setswana, by sex

### 3.29.8 Reason For Not Willing To Learn English By Sex

Table 60 in Appendix A shows that a substantial proportion (31.4\%) of participants indicated 'too old' to learn as the reason for not willing to participate in English lessons. Other reasons were as follows: "not interested' (25.6\%), 'poor sight', (19.5\%) and 'lack of time' $(15.5 \%)$. There were more males participants who advanced most of these reasons. Poor sight was expressed mainly by females. The challenge for practitioners and educators is to encourage eligible respondents to over come these obstacles so that they could access learning opportunities. Figure 25 shows reasons for not willing to learn English by sex.

Figure 25: Reason for not willing to learn English, by sex

## SECTION G: LITERACY IN OTHER LANGUAGES

### 3.30 Other Languages

There are efforts underway to promote minority languages such as Naro spoken by some Khoesan, Ikalanga by the Bakalanga and Shiyei by the Bayei, to mention a few examples. To assess the impact of these programs, literacy in other languages was assessed through self reports. Data in Table 66 Appendix A indicates the responses of people who were asked if they were literate in 13 other languages apart from Setswana and English. It revealed that people were literate in 10 of the 13 languages surveyed. The largest number or $44.0 \%$ of the people could read Sekalaka. The second highest number or $16.6 \%$ of the population could read Zezuru/Shona. SeKgalagadi, Shiyei, Sekgothu, and Sesarwa could each be read by less than 100 people. There were no people literate in Setswapong, Sebirwa, and Sesubiya. The largest percentage of people $19.4 \%$ who were literate in languages other than Setswana and English were in the 55-59 year age group followed by those in the $50-54$ year age group.

Data was further disaggregated by district and age. Tables 67 and 68 in Appendix A show the population of people aged 10 years and over who are literate in languages other than Setswana and English by district and age group. Central Tutume had the highest percentage (27.4\%) of people who were literate in languages other than English and Setswana. People who could read Sekalaka are concentrated in Central Tutume. In Central Tutume the majority of people who were literate in languages other than English and Setswana were concentrated in the 54 to 69 year age group. Ngamiland came second with $10.7 \%$ of the people. In general, literacy in languages other than English or Setswana increases with the increase in age.

## SECTION H: ECONOMIC ACTIVITIES

### 3.31 Economic Activity of Those Who Never Attended School or Left School Before Completing Standard 5

Literacy plays an important role in the modern production process. An educated labour force is most likely to be more efficient, productive and to engage in a variety of economic activities that carry financial rewards. This section relates literacy of an individual to their economic activities in general and more specifically to their status of employment as well as other labour force characteristics, such as occupation, industry and sector of employment. The United Nations System of Accounts describes economically active persons as those who supply labour for the production of goods and services for the market, barter or for home consumption. The production industry includes paid employment as well as a wide range of self-employed activities. Domestic chores such as cooking, child care and other reproductive activities mainly performed by women are however excluded from the selfemployed activities.

Table 61 shows the economic activities of the population ten years and above who never attended school or left school before attaining Standard 5(see Chart 26). Those who never attended school formed $70.9 \%$ of the population with $29.1 \%$ comprising of those with Standard One to Four. The most common economic activity for the whole population is 'homemaker' (39.6\%), followed by 'paid non-seasonal work,' (31.0\%).

Figure 26: Population 10 years and over by district, sex and current employment status

There are differences in the proportions of males and females engaged in paid non-seasonal work and the category of homemaker. In the population of those who never attended school and those with Standard 1 to 4, there are more men ( $71.7 \%$ ) than women engaged in nonseasonal paid work. This will seem to suggest that illiterate women have lesser chances of getting a job compared to illiterate men. There are in contrast to the category of paid nonseasonal work, more women ( $76.1 \%$ ) than men engaged in the category of homemaker. The economic activities seem to follow the gender role stereotypes where more men engage in economic activities for cash income, while more women are engaged in the multiple home chores for which they are not paid.

### 3.32 Economic Activity By Age and Sex

Data on Table 62 in Appendix A shows the economic activities of those 10 years and above according to age and sex (see figure 27). The data indicates that the majority of those engaged in unpaid seasonal work were in the age group 50 to 69 . The 50 to 69 year age group was also in the majority of those engaged in unpaid non-seasonal work. There were gender differences in the retirement age and school enrolment patterns. The data indicate that men were more likely to start retirement from the age of 40 years while women started retirement at the age of 55 years. There was also gender differences as regards 'student' which is listed as an economic activity (see Table 62). The data shows that there were no male students above the age of 49 years. In contrast, there were females students aged between 55 and 69 years.

Figure 27: Economic activity of those Who never attended school or left school before completing Standard 5

Economic activities

### 3.33 Working Population by Major Occupation and Sex

Table 63 in Appendix A shows working population aged 10 years and over whom never attended school or left school before completing Standard 5 by major occupation and sex (see figure 28). There were more males ( $63.1 \%$ ) than females in the working population. The data shows that the majority ( $64.2 \%$ ) of the employed respondents were engaged in elementary occupations, followed by craft and related trades ( $15.3 \%$ ) and skilled agriculture and related workers ( $11.6 \%$ ). There were no females in the legislators, administrators and clerk occupation category. The plant, machine operators and assemblers had a small proportion of female employees.
Figure 28: Trained population by course, sex, and level attained

### 3.34 Trained Population By Course, Level Attained And Sex.

Table 65 in Appendix A indicates trained population 10 years and over, who never attended or left school before completing Standard 5 by training course, level attained and sex. Data shows that transport and communication with $32.2 \%$ of the trained people was the most popular subject of training. The Construction trades program ranked second with $31.6 \%$ of the trained people, while craft and industry ranked third with $15.3 \%$ of the trained people. There were gender differences in the subject of training and the level of attainment. The construction and trades program which attracted $30.8 \%$ of the females was the most popular for the females, followed by transport and communication ( $28.5 \%$ ). With $34.7 \%$ of them in this training, males ranked first in transport and communication while construction and trades was the second preferred program ( $32.1 \%$ ). With $48.2 \%$ of them under this classification, a majority of the trained population had a certificate classified as 'other'. The second most popular certificate was the apprentice which attracted $38.8 \%$ of the of the people

### 3.34.1 Working Population by Industry and Occupation

Table 71 in Appendix A shows the types of occupations and the industries where those who never attended school or left school before completing Standard 5 were working (see figure 29). Data indicates that elementary occupations attract the largest $64.2 \%$ of this population, followed by craft related trades with $13.8 \%$ people and skilled agriculture and related works with $12.6 \%$ people. The largest number of these people $58.3 \%$ was employed in the agriculture, hunting and forestry industry. The second largest employer was construction industry which employed $9.7 \%$ of the people, while the wholesale and retail industry was the third largest employer with $6.9 \%$ of the workers. Males constituted $66.9 \%$ of the workforce while females were $33.1 \%$. The agriculture industry was the largest employer ( $58.3 \%$ ) of both males and females. The second largest employer for males was the construction industry which employed $10.3 \%$ of the male workers followed by the public administration industry employing $4.9 \%$ of them. In contrast the wholesale and retail industry was the largest employer of females. It employed $12.2 \%$ of them, followed by the private household industry which employed $11.5 \%$ of the females (see figure 30 ).
Figure 29: Working population by industry and and type occupation

Popular occupations
Figure 30: Working population, by industry, occupation and popular industries

Table 73 in Appendix A shows population aged 10 years and over by district, sex, and current employment status. The data indicates that the majority (59.9\%) of the population were employees paid in cash. Jobseekers constituted $21.5 \%$ of the population. Gaborone with of had the largest number ( $18.2 \%$ ) of employees paid in cash. Central Tutume ranked second with $7.4 \%$ of employee paid in cash while Central Serowe Palapye ranked third with $7.3 \%$ of the people paid in cash. Central Serowe /Palapye had the largest number, $12.9 \%$ of self employed people while Gaborone ranked second with $12.1 \%$ and Central Tutume ranked third with $8.9 \%$ of self employed people. The largest number or $23.3 \%$ of selfemployed people with employees was in Gaborone. Central Mahalapye had the highest number (15.7\%) of people working in the lands followed by Ngamiland West with 12.7\% of the people. Barolong had the highest unemployment rate ( $47.8 \%$ ) followed by Ngwaketse West (40.6\%).

### 3.36 Employed Population, and Language Requirements For Employment

Setswana is the national language while English is the official language. Participants were asked to indicate whether the use of either language was a requirement for employment in their current job. According to data on Table 79 in Appendix A , $37.7 \%$ of those employed revealed that reading and writing in Setswana was a requirement for employment in their current work. In contrast $46.8 \%$ indicated that reading and writing in English was a requirement for employment in their current job. The results are similar to the 1993 Literacy Survey findings. The majority or $35 \%$ of those for whom who reading and writing were equirements for employment at their work place were in the 45-59 year age range. Older people in the age range 65-69 years reported that reading and writing in English was not required in their employment. The pattern in the requirement of reading and writing for work was more or less the same for both males and females.

### 3.37 Employed Population Requirements In The Current Job

The largest number ( $17.0 \%$ ) for whom reading and writing was not a required in the current job was in the 35-39 age group followed by those in the 45-49 year age group which was $16.9 \%$ of the people. English was not required for the $10-29$ year age group and the 60 to 70+ age group. Reading and writing was required for females in the 30-39 year age group but was not required for males in the same age group (see figures 31, 32 and 33).

Reading and/or writing in Setswana used by Male
Figure 31: Population of males aged 10 years and over who use Setswana reading skills at work in current job

Figure 32: Population of females aged 10 years and over who use Setswana reading skills at work in current job

## Reading and/or writing in Setswana used by Female

Figure 33: Population aged 10 years and over who use Setswana reading skills at work in current job, both sexes

Reading and/or writing in Setswana used by Both Sexes

### 3.37.1 Employed Population Who Use Reading In The Current Job

Table 81 indicates the employed population aged 10 years and over who used reading and Writing in Setswana or reading and writing in English in their current job. The table shows that only $4.8 \%$ of the employed population never read and wrote in Setswana while only $5.8 \%$ never read or wrote in English (see figures 34, 35and 36). Once employed the majority of the employees read or wrote in English or Setswana. Reading and writing in Setswana is not used by for the 10-14 year age group only while reading and writing in English is not used by the 10-14 and the 65-70 year age groups. English reading was not used for males 10-24 and for females 10-29 years.
Figure 34: Population of males aged 10 years and over who use English reading skills at work in current job

## Reading and/or writing in English used by Male

Figure 35: Population of females aged 10 years and over who use English reading skills at work in current job

Reading and/or writing in English used by Female

Figure 36: Population aged 10 years and over who use English reading skills at work in current job, both sexes

## Reading and/or writing in English used ny Both sexes

3.37.2 Unemployed Population by School Attendance and Sex

Table 82 in Appendix A shows unemployed population aged 10 years and over by school attendance and sex. The largest number, $92.7 \%$ of job seekers had left formal school.

Figure 37: Unemploved population aged 10 vears and over bv school attendance and sex 2003

### 3.38 Unemployed 10 years and Over by Age Group and Sex

Table 83 in Appendix A indicates the unemployed population aged 10 years and over by age and sex (see figure 38). The largest number or $37.2 \%$ of jobseekers was in the 20-24 year age category, followed by the 25-29 year age group with $21.2 \%$ of jobseekers. There were gender differences in jobseekers by age. Female jobs seekers generally increased with age while male job seekers decreased with age (see figure 38).
Figure 38: Unemployed population aged 10 years and over by age group and sex 2003.38.1 Unemployed 10 years and Over by District and Sex

Table 84 in Appendix A shows the unemployed population 10 years and over by district and sex. Gaborone had a larger proportion ( $10.4 \%$ ) of jobseekers compared to other towns. Kweneng East had the highest proportion of jobseekers ( $15.3 \%$ ). There were more female jobseekers than males in all the districts. Females formed the largest proportion (53.8\%) of job seekers.

## SECTION H: DISCUSSION, SUMMARY AND RECOMMENDATIONS

The report presents a discussion and recommendations based on the findings of the survey. The discussions and recommendations are organised around the sections in the analysis and results chapter.

### 3.39 Adult Literacy Rates

The analysis shows that literacy rates for adults 15 to $65+$ increased from $68.9 \%$ in 1993 to $81 \%$ in 2003. The national adult literacy rate therefore increased by about $12 \%$. Botswana's goal was to increase the national adult literacy rate from $68.9 \%$ in 1993 to $90 \%$ by 2003. If the literacy rates continue to increase by $12 \%$ every ten years, Botswana is most likely to have a literacy rate of about $93 \%$ in 2013.

A further analysis of literacy rates by district revealed that the town districts of Gaborone, Francistown, Lobatse, Selibe Phikwe, Orapa, Jwaneng and Sowa Town had exceeded the $90 \%$ literacy level set after the 1993 national literacy survey. Literacy rates for these town districts range between $92 \%$ and $98 \%$. There were wide disparities of literacy attainment by district. Kweneng West, Ghanzi, Ngamiland West, Kgalagadi North, Kagalagadi South, and Central Boteti had literacy rates below the national literacy rate. Worse still, literacy rates in these districts were below the $68.9 \%$ national literacy level achieved in 1993.

There were also differences in literacy attainment based on age and sex. Data revealed that those 40 years and above had literacy rates below the national literacy rate of $81 \%$. It is recommended that literacy levels to be achieved by 2013 be set for this age group. A marked increase in literacy for this age group could significantly increase the literacy rate by 2013. Gender differences in literacy range between $0 \%$ (no difference) and $11 \%$. The largest difference in literacy rates between females and males was in Kgatleng where female literacy rates was higher than male literacy rates by $10 \%$.

Nineteen percent of Batswana Citizens remain illiterate. In line with the Dakar Framework of Action (2000), Botswana's goal is to reduce illiteracy by $50 \%$ by 2015 . It is recommended that the disparities of attainment of literacy that exist between the districts be addressed. There is need to set literacy levels to be achieved by 2013 in districts with literacy levels below the national literacy rates. Priority should be given to those districts with literacy rates below the 1993 national literacy rate of $68.9 \%$. Districts with higher gender differences in literacy rates need urgent attention if the country is to achieve a $100 \%$ literacy rate.

The age specific literacy rates differences have implications for curriculum planning, especially the types of materials that are developed in the adult literacy programmes. It is recommended that research be carried out on age specific literacies and literacy materials and that the information be used to design the literacy course materials that address and meet the needs of different age groups.

### 3.40 Population That Never Attended School

Data revealed that districts with low literacy rates also had high proportions of people who never attended both formal and non formal school or left school before completing Standard Five. On the whole, the national proportion of the population 12 years and above who never attended school decreased from 21.3\% in 1993 to 10.5 in 2003.

There is a total of 5,371 children aged $10-14$ years who never attended both formal and non-formal school or left school before completing Standard 5. These children are concentrated in Kweneng West, Ghanzi, Kgalagadi North and Central Boteti. The challenge is to provide 10 years of basic education as well as life skills and HIV/AIDS education to these children. During NDP 9 Government will 'construct and equip six out of school education resource centre for out of school education programs'. It is recommended that in constructing the centres, priority be given to these regions.

### 3.41 Participation in the Literacy Program

## Access, Enrolment

The 2003 literacy survey investigated enrollment, retention and drop out of participants in literacy programs. The results revealed that about $71 \%$ of the eligible population never attended literacy classes. In the 1993 national literacy survey, $81 \%$ of the eligible population did not attend literacy classes. The current survey thus shows a $10 \%$ increase in enrolment. Unfortunately, it appears the number of people who had no plans to enrol in any programme had increased from $18.8 \%$ in the 1993 to $23.6 \%$. The majority of the learners had either not completed Primer 1 or had completed Primer 1 and 2. Another important finding was that literacy classes were attended mainly by adults 15 years and above. The few children 10-14 years who enrolled dropped out of the program. It could not be determined through the data if the children who dropped out of the literacy program were enrolled in the formal school system. It is recommended that future surveys include questions that determine rates of enrolment of primary age children into the literacy program and their transfer back to the formal primary education system.

One of the critical issues addressed by the survey was the period of attendance for literacy participants. The data revealed that the majority took less than one year to two years to complete Primers land 2 while they needed more than 2 years to complete Primers 3, 4 and 5. All those enrolled for English as a Second Language completed it in 1-2 years.

The drive for enrolment has also to be directed at males who account for $80.6 \%$ of those who never attended the literacy programme. This necessitates a further analysis of issues influencing attendance in the literacy program. Reasons for never attending literacy were as follows: 'not interested' affecting more females, 'lack of time' affecting more males. 'No facilities, 'parents not interested' and 'did not know it existed'. These reasons are similar to those advanced in the 1993 survey, which suggests that in spite of the relative increase in enrolment, reasons stopping people from accessing the programme have not changed in a decade. It is recommended that DNFE adopt more flexible time schedules to suit the lives of learners, for example, resorting to evening classes using primary schools classrooms where possible. Participants should also be involved in developing materials to enhance their interest in the programme. Literacy planners should also be encouraged to be innovative in the planning of literacy programmes and to encouraging participants to view literacy education as a lifelong process rooted in their daily lives.

### 3.42 Reasons for Absenteeism and Dropping out in the literacy classes

One way to determine programme impact is to look at the reasons people advance for missing and or leaving the programme. The survey found the following as the major reasons for missing literacy classes: 'Ill-health,' 'no instructor,' 'taking care of a family members,' all these factors affected more females than males. On the other hand, others
cited 'job demand', this factor affected more males than females. Most of these reasons were advanced for missing literacy classes in the 1993 survey. The problem of no instructors, is very critical because it sits at the nerve of the operations of the programme. It is recommended more effort be directed to recruitment and retention of instructors in the literacy programme to ensure continuity. This would be in line with the recommendation of the Revised National Policy on Education, which called for the improvement of the conditions of services for this cadre. An emerging reason is that of taking care of 'ill family member', which probably stems from the HIV/AIDS pandemic.

While some missed classes, there were those who left the program. Their main reasons for leaving were as follows 'other' reasons, this affected more males than females; 'lost interest', 'ill-health' being cited by more females than males; and 'looking after cattle' and 'working at the lands', affecting more males. Based on the above reasons, there is an urgent need to unpack 'other reasons' to clearly delineate reasons for leaving the literacy programs. It is recommended that the DNFE consider to conduct a small scale focused survey combined with focused group discussions with those who left the literacy programme over the years to establish why they left and what in their view could be done to improve its delivery. It is further recommended that those males looking after cattle or working at the lands should be taught at cattle posts and farms where they are working. Aspects of what is suggested are already taking place in the Chobe enclave villages and other places. The Department only needs to enlarge the scale and coverage to other places where it could be applicable (Maruatona, 1998). It is also recommended that an accountability system that involves the community leaders be put in place to help monitor the activities of the instructors. The system should take responsibility for hiring and monitoring the activities of the instructors to ensure that they actually teach at scheduled places and times. This would enhance community ownership of the programme.

### 3.43 Literacy Tests.

The 1993 Botswana survey did not show any major differences in what the respondents reported and their performance in the tests. For instance, only $2.8 \%$ of those who said they could read failed the Setswana reading test. The differences in self-proclamation and test results were smallest in English reading and writing. Chilisa (2003) observed that what the results communicated could be that the items used to measure reading and writing in Setswana were at a level that matched the respondents' conceptions of what it meant to them to be able to read and write. Another interesting result was that previous formal school experience did not seem to have influence on candidates' performance. There were no marked differences in proportions of candidates passing the tests according to grade or primer level. One would expect, for instance, that those who had four years of formal schooling would do better than those with no years of formal schooling. In interpreting the results, CSO (1997) explained that the lack of differences in respondents' performance according to grade or primer level could be due to the fact that people with some formal schooling may regress to illiteracy due to lack of reading and writing practices. Another possible explanation could be that the test items assessed the bare minimum competencies, which anybody who claimed the ability to read and write should have acquired. These could also be described as the prerequisites skills to higher ability competencies in reading, writing and numeracy.

The tests results in the 2003 literacy survey were different from those observed in the 1993 household survey. A comparison of participants self-proclaimed literacy with their performance in literacy tests revealed that between $20 \%$ and $27 \%$ of those who proclaimed
some level of skill in reading and writing in Setswana and English were incompetent in the skills assessed. Test results in Setswana reading and writing and numeracy for those who attended the National Literacy Program showed that performance in the upper primers, namely Primer 4 and 5 was better than that in the lower primers. Performance in English writing and reading showed no difference among the primers. This outcome should however, be interpreted with caution because the number of participants who took the reading and writing English tests was small. Similarly, performance in the literacy tests improved with the increase in the level of educational attainment. Those with Standard Three and Four did better than those with less education. It was also interesting to note that those who were self-taught performed at the level of those with Standard Three or Four. The majority of the participants who took the literacy tests demonstrated 'some competence' in all the tests, indicating minimal level of mastery of the skills assessed. This is understandable because the majority of those who took the test either had less than Standard Four or had not completed Primer 5.

### 3.44 Determining the Literate Population

Mean scores for only those who took all the English and Setswana reading, writing and oral tests as well as numeracy were computed to determine the literate population. Only about $3 \%$ of the eligible population took all the tests. English writing, reading and oral had the smallest number of candidates. The low participation in English tests could be due to the fact that English is only introduced when the participants show an interest or feel ready. If this practice/policy continues, it is unlikely that literacy tests will raise the national literacy rate in any significant way. Given that English reading and writing and oral skills are a requirement for employment for a significant number of people, it is recommended that English reading and writing skills be introduced as early in the program as possible so that by the time participants are in Primer 5 they have acquired the basic skills required for literacy in the subject.

There were disparities of performance in the tests by districts, age and sex. Kweneng, East, Ngamiland West, Central Bobonong and Central Tutume, Kweneng East recorded highest failure rates in some of the tests. Males performed better than females in almost all the tests although there were variations by districts. Perfomance improved with age. Those 45 years and above generally performed better in almost all the tests than those below younger. It is recommended that gender, and age differences in performance be addressed. There is need to find out why performance improved with age and to use the information to develop enrichment materials and activities for those below the age of 45 years. Studies of gender sensitive of the curriculum and the tests used need to be carried out to fully understand sources of gender differences in performance.

## Methodology

Though the exact effect of the very low number of participants who took the literacy tests on the literacy rate cannot be determined, it is known that the larger the sample size, the more the estimate based on such sample approaches the population value. The number of participants who took each of the items ranged from a high of about 2,500 for eight items to a low of 107 for nine items with only one participant answering such items in some districts. Effort should be made not only to increase the sample size taking the literacy test, but also to decrease the discrepancy in the number of participants who take each item. This maight require an alternate way of determining literacy levels of participants based on their responses to literacy test items.

It is recommended that the Literacy Assessment and Monitoring Programme (LAMP) proposed by UNESCO be adopted to improve the assessment of literacy skills. LAMP seeks to improve how literacy is measured, and to provide countries with the tools for collecting adequate literacy statistics, in order to support evidence-based policy development and monitoring at national and international levels, and to help improve the design of literacy programmes. According to Terrryl (2003) LAMP seeks to achieve this aim through three main objectives:

- Developing a methodology for assessing literacy in developing countries, measuring a spectrum of literacy levels from very basic reading and writing to high level skills needed to fully participate in a learning society;
- Collecting literacy data to assist with policy-making, monitoring and programme design in participating countries and at the international level;
- Building statistical capacity in participating countries, in particular in the areas of surveys and of literacy assessment, and their use for improving policies and intervention strategies.

During the assessment, literacy tests developed by individual countries are administered to individuals. A 'filter test' is administered to an individual to establish their general literacy abilities. The individual might be oriented towards either test A or test B depending on the results. The filter test separates those respondents with a 'higher' or 'lower' level of literacy and asks them to complete different tests. This helps to ensure that respondents are presented with tests that are more appropriate for their level. In order to estimate the respondent's level of proficiency in literacy, the responses to the test are analysed using the Item Response Theory. To project the results from the sample to the whole population, the statistical technique of model-based estimation is utilised. Direct estimation is used for the overall figures and model-based estimation is used for smaller sub-groups. This approach requires a small-scale survey. The approach requires fewer interviews but provides estimates of the same accuracy as the more traditional and direct estimation methods. It does so by using knowledge of the relationships between literacy and demographic and socio-economic characteristics, and of auxiliary data available from larger surveys. The same technique could be used to derive literacy estimates in years where no assessment is conducted (Terryl, 2003). It is recommended that if this approach is adopted, planning for capacity building and test construction should start immediately.

### 3.45 Literacy Learning Environment

Participants were also asked to indicate perceived importance of reading and writing skills in their lives. Data showed that 'better communication', 'knowledge's sake' and 'getting a better job' were the main reasons expressed for learning how to read and write. Participants were also asked to indicate the sources of their literacy skills. Just like in the 1993 National Literacy Survey, most people pointed to formal school and literacy programme as the main sources of their literacy skills. Literacy skills were also required for employment purposes. Of those employed, 37.7 \% revealed that reading and writing in Setswana was a requirement for employment in their current job. In contrast $46.8 \%$ indicated that reading and writing in English was a requirement for employment. The 1993 literacy survey also revealed that English was required more than Setswana for employment purposes. The survey found that $35 \%$ of those for whom reading and writing was a requirement for employment were in the 45-59 year age range. Once employed, the majority of the employees reported that they read or write in English or Setswana as a requirement. Only
$4.8 \%$ of the employed population never read and write in Setswana while only $5.8 \%$ never read or write in English.

The use and impact of literacy skills was determined based on the types of materials learners read in Setswana and English (Table 52). Participants in Setswana mostly read religious books and newspapers. The least read materials were novels. While most people read religious materials, it still has to be established whether the literacy programme actually provides them with essential skills necessary to read these religious materials. In English, most people read newspapers, mostly read by males, who either had access to them or could afford to buy them. The least used English materials were textbooks. A comparison with the 1993 survey shows a drop in the readership of Setswana newspapers from $30.9 \%$ in 1993 to $22.4 \%$. Also, more people ( $28.2 \%$ ) read Setswana text books compared to the current ( $12.8 \%$ ).

One major challenge involved those who for various reasons never read anything in Setswana and English (Table 54). Most people never read anything mainly because they had nothing to read or because of poor eye sight. This could be attributed to the fact that Government discontinued a Setswana newspaper pull out it used to provide free of charge for neo-literacy in the past. It is therefore recommended that there should be an increase in the availability of materials to be read. This can be achieved through introducing pull outs for neo-literates in Setswana newspapers or they could be inserted bi-weekly in the government daily newspaper. The DNFE could also work with the BotswanaNational Library Service to extend the Village Reading Rooms to cover all parts of country. It is recommended that the concerned departments work with communities through drought relief to build appropriate shelters to store books and newspapers in rural areas. They could ask some individuals to donate shelters to be used as libraries in villages to avoid placing them in schools, where they were used more by children than adult (Mchombo \& Mutanyatta, 1991). It is recommended that the scope of coverage for English teaching should be enlarged to include suitable materials for neo-literates, especially through the anticipated Adult Basic Education Course.

The use of literacy skills was also established through determining the type of materials written by those who could write (Table 53). In Setswana, they mostly wrote letters. Others wrote on work related matters. In English, most wrote letters, and work related materials which affected males only. Closely related to these are reasons for never writing in both Languages. In Setswana, $57.4 \%$ did not write anything because they had nothing to write. In English, $56.7 \%$ had nothing to write. Females also pointed to 'lack of interest' as a reason for not writing in English. This is a new phenomena compared to the 1993 literacy survey findings.

Creating a literate environment is a prerequisite for people to retain their hard earned literacy. The current situation in the DNFE is not supportive of such an endeavour because it does not provide newspapers in any language appropriately pitched for neo-literates. It is therefore recommended that the DNFE introduce a newsletter, to which neo-literates would contribute. The newspaper will have to be locally operated with Literacy Assistants (supervisors), literacy teachers and learners to editing it and being responsible for its sale or free distribution to the local community. The anticipated net effect is for the newspaper to serve as an outlet for their writing skills and also cultivate a literate environment. It is further recommended that work related writing be strengthened in order to make more impact on their economic situations. Females should be encouraged to start small
businesses and use their literacy skills to engage in fruitful activities such as keeping books of accounts.

Another subtle challenge involves individuals who are reported to be willing to learn in both Setswana and English, but who could not access literacy. The programme still faces some challenges in its implementation because there are people who are unwilling to learn Setswana and English who have several reasons for not accessing the skills. Reasons cited include being 'too old,' 'not interested' and 'poor eye sight.' In the 1993 survey, all these reasons were advanced though there is a significant drop in the respondents who cited being 'too old' as the main reason for never attending English classes. Based on the above reasons, it is recommended that DNFE work closely with the clinics and other health facilities to address 'poor eye sight' with the hope that once assisted most females would enrol in the programme because the literacy programme is mostly patronized by them.

### 3.46 Literacy in Other Languages

The data shows that other than Setswana and English, people were literate in 10 other languages. The largest proportion (44\%) of of these people could read Ikalanga. Ikalanga was used as a medium of instruction in Primary schools in some parts of the country before independence in 1966. This may explain the high concentration of people who say they could read and write Ikalanga in the $50-59$ year age group. This is also the age group with high illiteracy rates. What may be of interest is whether passing English and Ikalanga or English and any other language may change the literacy rates.

The primers and the post literacy material in the National Literacy Programme use Setswana, the national language. This is required by the definition of literacy, which originally defines a literate person as being able to read, write and renumerate in Setswana. The exclusive use of Setswana for minority communities creates a dissonance between their life experiences, culture and literacy expectations. However, the survey found that people spoke and wrote in other languages such as Ikalanga, and Sezwesuru. UNESCO recommends the use of mother tongue because it make it easier for people to learn and it also helps to retain their cultural identity and save minority cultures from getting extinct.

The Revised National Policy on Education recommended that if requested by parents the school should make arrangement to teach any local language as a co-curricular activity. The Government of Botswana through its Vision 2016 advocates for the recognition of all cultural groups in order for Botswana to be a tolerant nation by 2016. It is recommended that where possible, DNFE should develop materials other mother tongue languages for use during the initial stages of learning in the programme. It is hoped that later learners could be introduced to Setswana, which they need to improve their socio-economic situations. It is also recommended that DNFE could work with Non-Governmental Organisations to develop post-literacy materials in these languages for people to use in order to help preserve their culture and informally teach the languages to their children. This would be in line with one of the RNPE recommendations, which requested the Department of NonFormal Education to create a literate environment and support productive activities.

### 3.47 Economic Activities, Employment and Training Opportunities

The most common economic activity for the population that never attended school or left school before completing Standard 5 is 'homemaker' ( $39.3 \%$ ), followed by 'paid seasonal work,' $30.8 \%$. There were differences in the proportions of males and females engaged in paid non seasonal work and the category of homemaker. There were more men (68.8\%) than women engaged in non-seasonal paid work. This will seem to suggest that illiterate
women have lesser chances of getting a job compared to illiterate men. There are more females ( $75.8 \%$ ) than males engaged in the category of homemaker. The economic activities seem to follow the gender role stereotypes where more men engage in cash income economic activities while more women are engaged in the multiple home chores for which they are not paid.

There were more males (64.2\%) than females in the working population. The data shows that the majority of the employed respondents were engaged in elementary occupations, followed by craft and related trades and skilled agriculture and related works. There were no females in the legislators, administrators and clerk occupation category. The plant, machine operators and assemblers had a small proportion of female employees. Data showed that transport and communication was the most popular subject of training followed by the Construction trades program and the craft and industry. There were gender differences in the subject of training. The construction and trades program was the most popular for females, followed by transport and communication. Males' first preference was transport and communication while construction and trades was the second preferred program.

### 3.47.1 Economic Activities For DNFE

The DNFE has a section responsible for income generating or functional literacy projects across the country. Most of the projects have not been running that well, but are operational. For example, in Ramotswa village, there is a pre-school to look after the children whose mothers are working. They also have poultry, bread and candle making projects most of which are home economics based. In order to establish an income generating project learners are encouraged to form groups to be assisted by different extension programs. But such groups have proven very difficult to keep together. Now individual learners are encouraged to set up their own small businesses. However, the current survey failed to include questions on income generating or economic activates of literacy participants. It is therefore recommended that future surveys should include questions on the operations and impact of the functional literacy projects in the Department of Non-Formal Education.

It is recommended that the provision of Adult Basic Education Course (ABEC) as recommended by the Revised National Policy on Education (RNPE) be made a priority in order to enhance access to literacy opportunities in Botswana. It is further recommended that the course use the economic activities, employment and training opportunities of the group to inform the development of the future ABEC curriculum.

## APPENDIX A: TABLES

Table 1a: Number of households and eligible persons, and response rates, Botswana, 2003

|  | Place of Residence |  |  | Total |
| :---: | :---: | :---: | :---: | :---: |
|  | Cities/ towns | Urban villages | Rural |  |
| Sampled households | 2040 | 2240 | 3000 | 7280 |
| Completed households | 1910 | 2123 | 2827 | 6860 |

# APPENDIX B: SURVEY METHODOLOGY AND SAMPLE CHARACTERISTICS 

### 4.1 Objectives, Target Population and Scope \& Coverage

### 4.1.1 Objectives

The survey was designed to measure the country's literacy not only by the number of years spent at school (formal school) but also through objective testing of "Literacy Skills" as well as its utility value and numeracy.

### 4.1.2. Target Population for Literacy Test

Literacy tests were applied to a population who otherwise assumed illiterate. Criteria were derived to select population eligible to take such literacy test, referred to, as "eligible population". These criteria are:

- Only Botswana Citizens
- 10-70 years old
- Never attended or left school before completing Standard 5.

### 4.1.3. Scope and Coverage

Only private dwellings were within the scope of the survey. Institutional dwellings (prisons, hospitals, army barracks, hotels, etc), Ngamiland Delta, CKGR and with completely industrial area were not within the scope of the survey.

The non-citizen tourists who were in Botswana on holidays and not working here were also not included in the survey. Foreign tourists may, of course, be here as visitors to a selected household for the survey. In such cases they were treated as visitors, their names were recorded and the relevant questions were asked about them only at household level. The coverage was nation-wide using administrative sub-districts that are usually used by the Central Statistical Office.

### 4.2 Sampling Frame, Stratification, Sample Size and Allocation, and Sample Design

### 4.2.1 Sampling Frame

In general the 2001 Population and Housing Census, undertaken in August, is the Sampling Frame on which sample selection for the Survey Programmes are based. The census result gives information on population, number of household at Locality, Enumeration Area (EA), village and district/town levels. Also given for each EA is information on ecological zones in rural areas..

The Sampling frame was defined and constituted by all Enumeration Areas (EAs) found in three geographical regions viz. (i) Cities \& Towns (ii) Urban Villages ${ }^{1}$, and (iii) Rural Districts as defined by the 2001 Population and Housing Census.

Being a two-stage design, two frames were required one for each stage. The sampling frame for the first stage based on the 2001 Population and Housing Census. This comprised the list of all Enumeration Area (EA) together with number of households. In the census the EAs were framed of manageable size (in terms of dwellings/households). Consequently, the Blocks and EAs are synonymous. So the primary sampling units (psu) were EAs.

The sampling frame for the second stage was produced only in the selected EAs. Before the beginning of the survey interviews, the field teams listed all private habitable dwellings/households in their EAs. Thus the number of occupied households in the selected EA served as sampling frame for that EA.

Remarks: The EA's in the army barracks, Ngamiland delta, Institution (without any households) and with completely industrial area were also excluded.

The frame for the Botswana Literacy Survey 2003 consisted of 4,114 EAs being the total number of Enumeration Areas (EAs) delineated during the 2001 Population and Housing Census after taking out the 38 EA's of the CKGR, Delta and Institutions.

### 4.2.2 Stratification

When national level estimates are the main focus a type of stratification that is simple to implement and highly efficient is implicit stratification. It is a form of geographic stratification, which when used together with systematic pps sampling automatically distributes the sample proportionately into each of the nation's administrative subdivisions, as well as the urban and rural sectors.

Creation of strata is dictated by two principal criteria. These include a need to:
i. provide estimates for each major region of the country.
ii. increase precision

Thus, stratification variables included cities/towns and administrative districts.

Apart from national and rural estimates, the Government, which is the main user of CSO data, requires accurate estimates for all regions for planning and monitoring of development projects. Stratification was therefore undertaken such that all districts and major urban centres become their own strata. With regard to increase precision consideration was also given to group EAs according to ecological zones in rural districts and according to income categories in cities/towns.

[^0]Geographical stratification along ecological zones and income categories was expected to improve the accuracy of survey data in view that homogeneity of the variables was relatively high.

There are five major rural ecological zones, namely:

```
-Village,
-Lands
-Cattle Post
-Freehold Farms
-Mixture of Land and Cattle Post
```

During the delineation of the maps, each EA was associated with unique ecological zone and thus, grouping the EAs into respective zones was not a problem. To facilitate the selection according to the stratification variables, the EAs were listed in some order, for example starting cattle post, then farms etc. in case of rural areas.

### 4.2.3 Sample Size and Allocation of Sample (Households) to Strata

The size of the sample is perhaps the most important parameter of the sample design, because it affects the precision, the cost and duration of the survey more than any other factor. With the other statistical determinants, the overall sample size for BLS-2003 has also taken consideration of the numbers of PSUs (EAs) and SSUs (households). After few revisions, it was decided to include around 7280 households in the sample.

Remarks: Two general rules of thumb govern the choice on numbers of PSUs (EAs) and SSUs (households): (i) the more PSUs, it is better, as both geographic representation, or spread, and overall reliability will be improved; and (ii) the smaller the number of SSUs, the more reliable estimates will be.

For BLS-203 the sample (households) was allocated into strata proportionally to the total number of household as per 2001 Census (see Table 1).

## Note

Col $3=$ Households in sample are distributed proportional to households in population
Col $4=$ Number of Households in Col 3 divided by the number of households to be selected per EA (20 households per EA)
Col $5=$ where the number of EAs in col 4 was less than 4 were raised to 4 , to have minimum 4 EAs in each census district/stratum.
**Urban Villages: These are villages each with a 2001 Census population of 5,000 or more and at least 75 percent of its workforce engaged in non-agricultural economic activities. In total there are now 27 urban villages.

Stratum 8 (Urban Villages) is a derived stratum of EAs of Urban Villages of Rural Districts (Strata 9-27).

Remark: Complete rural district results will need the estimation of any urban small town or urban village component to add to the rural component.

### 4.2.4 Sample Design

A stratified two-stage probability sample design was used for the selection of the sample. The first stage was the selection of EAs as Primary Sampling Units (PSUs) selected with probability proportional to measures of size (PPS), where measures of size (MOS) were the number of households in the EA as defined by the 2001 Population and Housing Census. In all 364 EAs were selected with probability proportional to size.

At the second stage of sampling, the households were systematically selected from fresh list of occupied households prepared at the beginning of the survey's fieldwork (i.e. listing of households for the selected EAs). Overall 7280 households were drawn systematically.

## (a) First Stage: Sampling of EAs

In the first stage, the EAs were systematically selected with probability proportional to measures of size (PPS), where measures of size (MOS) were the number of dwellings/households in the EA as defined by the 2001 Population and Housing Census.

The procedure for selecting the EA in each stratum consists of:
(i) Calculating the sampling interval for the stratum:
$\mathrm{I}=\sum \mathrm{M}_{\mathrm{i}} / \mathrm{n}$
Where;
$\sum \mathrm{M}_{\mathrm{i}}$ is the size of the stratum (total number of households in the stratum according to 2001 Census) and ' $n$ ' is the number of EAs to be selected in the stratum.
(ii) Calculating the cumulated size of each EA.
(iii) Calculating the sampling numbers $R, R+I, R+2 I, \ldots, R+(n-1) I$, where $R$ is the random number between 1 and I.
(iv) Comparing each sampling number with the cumulated size.

The EA to be selected was the first whose cumulated size was greater or equal to the sampling number.

## (b) Second Stage: Sampling of Households

Upon completion of households listing, the household lists were carefully checked. Household numbers was assigned to each household in the EA, Vacant and nonresidential structures and structures under construction were not numbered. The total number of households in the EA was the last household number assigned in the EA.

The listing operation was used mainly to update the measures of size at the EA level for second stage sampling.

The criterion for the number of households allocated in the EA was fixed because of administrative convenience and spread of sample over strata.

The Systematic selection of households consist of:
(i) Calculating the sampling interval for the stratum:
$\mathrm{I}=\mathrm{M} / \mathrm{m}$
Where;
$M$ is the total number of occupied households listed in the stratum and ' m ' is the number of households to be selected in the stratum.
(ii) Calculating the sampling numbers $R, R+I, R+2 I, \ldots, R+(m-1) I$, where $R$ is the random number between 1 and I .

### 4.3 Calculation of Sampling Weights

Being a multistage design, it follows naturally that the sample selected at each stage represents (or is assumed to) the respective population. The fundamental assumption was that units selected at each stage were similar to those not selected, in respect of characteristics of interest. In the treatment of unit for the non-response the assumption that the responders were similar to non-responders though should not be always taken for granted.

The weights of the sample are equal to the inverse of the probability of selection. Therefore the sampling probabilities at first stage of selection of EAs including probabilities of selecting the households were used to calculate the weights.

There are three components to the weighting:

## (i) From EA to Stratum Level

First stage weights account for the varying probability of EA selection. That is they are proportional to the inverse of the size measure.

First stage weight for i-th EA in h-th stratum is

$$
\mathrm{W}_{\mathrm{lhi}}=\frac{\sum_{\mathrm{i}} \mathrm{M}_{\mathrm{hi}}}{\mathrm{n}_{\mathrm{h}} \mathrm{M}_{\mathrm{hi}}}
$$

Where,
$\mathrm{W}_{1 \mathrm{hi}}=$ First stage weight for i-th EA in h-th stratum.
$\mathrm{n}_{\mathrm{h}}=$ The number of EAs selected in $\mathrm{h}^{\text {th }}$ stratum.
$\mathrm{M}_{\mathrm{hi}}=$ The size (households according to 2001 Census frame) of the i-th EA in h-th stratum
$\sum_{\mathrm{i}} \mathrm{M}_{\mathrm{hi}}=$ The total size of the $\mathrm{h}^{\text {th }}$ stratum (2001 Census frame).

## (ii) From Household Level to EA Level

This is a simple weight obtained by dividing the total occupied households in the EA by the number of selected households in that EA.
Second stage weight for i-th EA in h-th stratum is

$$
W_{2 h i}=\frac{M_{h i}^{o}}{m_{h i}}
$$

Where,
$\mathrm{W}_{2 \mathrm{hi}}=$ Second stage weight for i-th EA in h-th stratum.
$M_{h i}^{o}=$ Total number of listed households in i-th EA in h-th stratum.
$\mathrm{m}_{\mathrm{hi}}=$ The number of occupied households selected for the i-th EA in h-th stratum.

## (iii) A Non-Response Adjustment

For the Botswana Literacy Survey no substitution was allowed for non-response and household questionnaire had to be returned for all households, responding or nonresponding. The response codes and corresponding results are:

| Resul <br> t |  | Percent Response Code |  |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: |
|  | Final Visit Result | Cities/ <br> Towns | Urban <br> Villages | Rural | Total |
| 1 | Completed | 93.14 | 94.69 | 93.80 | 93.89 |
| 2 | No one at home (Non Contact) | 5.98 | 5.0 | 5.63 | 5.54 |
| 3 | Postponed | - | 0.09 | 0.03 | 0.04 |
| 4 | Refused | 0.39 | 0.09 | - | 0.14 |
| 5 | Partly completed | 0.49 | 0.13 | 0.43 | 0.36 |
| 6 | Other: Dwelling Vacant/ Dwelling | - | - | 0.10 | 0.04 |
|  | out of scope |  |  |  |  |
|  | Total | $\mathbf{1 0 0 . 0 0}$ | $\mathbf{1 0 0 . 0 0}$ | $\mathbf{1 0 0 . 0 0}$ | $\mathbf{1 0 0 . 0 0}$ |
|  |  | $\mathbf{( 2 0 4 0 )}$ | $\mathbf{( 2 2 4 0 )}$ | $\mathbf{( 3 0 0 0 )}$ | $\mathbf{( 7 2 8 0 )}$ |

Only non-contact and refusals were taken as non-response. The other sample loss was effectively taken as zero i.e. no one lived in these households. The non-response rate was made at the EA level. The adjustment was equal to the presumed total households in the EA (codes $1+2+4+5$ ) divided by the presumed valid response in that EA (codes $1+5$ ). In effect non-contacts and refusals were given the characteristics of average valid respondents in the EA.

The non-response adjustment for the i-th EA in h-th stratum

$$
\mathrm{R}_{\mathrm{hi}}=1+\frac{\mathrm{m}_{2 \mathrm{hi}}+\mathrm{m}_{4 \mathrm{hi}}}{\mathrm{~m}_{1 \mathrm{hi}}+\mathrm{m}_{5 \mathrm{hi}}}
$$

Where $\mathrm{m}_{\mathrm{jhi}}$ is the number of occupied households falling under j -th $(\mathrm{j}=1,2,4$ and 5 ) result code in i-th EA of h-th stratum.

Thus, the final weight for the i-th EA in $h$-th stratum is

$$
\mathrm{W}_{\mathrm{hi}}=\mathrm{W}_{1 \mathrm{hi}} \cdot \mathrm{~W}_{2 \mathrm{hi}} \cdot \mathrm{R}_{\mathrm{hi}}
$$

### 4.4 Household and Individual Questionnaires

The questionnaires are the primary recording documents of the survey. In the development of the questionnaires, along with the professionals, the other members (Including some users) were also invited. The final version of the questionnaires were finalized on the basis of the experiences gained from the Pilot Survey conducted using the drafted questionnaires for the survey. The 2003 BLS consisted of two questionnaires, namely
iii. The Household Questionnaire, and
iv. The Individual Questionnaire

### 4.4.1 The Household Questionnaire

This questionnaire is a standardized questionnaire of the CSO's Household Survey Programme except with a little modification as per the need of the designated survey. This questionnaire also set the criteria for eligibility of being an BLS individual questionnaire respondent.

The Household questionnaire was divided into four major sets of questions, namely
i. Socio-Demographic Characteristics
ii. Education and Social Characteristics
iii. Employment Status and Other Economic Characteristics
iv. Eligibility Criteria for being an individual questionnaire respondent

Eligibility Criteria was not a question asked by the respondent. It was meant for the interviewer to identify persons who were eligible for an individual questionnaire respondent.

Criteria: "Those respondents who were aged 10-70 years and were usual members of this household were eligible for an individual respondent."

### 4.4.2 Individual Questionnaire

All the eligible individuals from the household questionnaire were asked the questions on the individual questionnaire.

The process of individual questionnaire development was not a simple task. The challenge was to develop the types of questions that led to achieving the survey objectives. Standardised questionnaire were developed so as to provide the basis for current (where feasible) and future comparability. More specifically, questions and the design structure of the questionnaire took into full account a set of objectives spelt out in chapter 2 , with a view to address them.

The individual questionnaire has the questions mainly on the following topics:
i. School Attendance (left and never attended).
ii. Literacy classes.
iii. Setswana reading and writing tests.
iv. English reading and writing tests.
v. Numeracy test
vi. Setswana or English oral tests
vii. Language other than Setswana or English

### 4.5 Pre-Test, Training of Field Staff, Field Team, Listing of Households and Quality Control Measures

### 4.5.1 Pre-Test

The Botswana Literacy Survey instruments (household and individual) were pre-tested in areas in and around Gaborone. Households were selected at random form EAs belong to different strata according to the stratification in the sample design.

### 4.5.2 Training of Field Staff

A team of 12 officers trained the field staff for the Botswana Literacy Survey. Among the trainees there were 40 supervisors and 86 enumerators trained over a period of two weeks (15-24 September 2003). Of the 86 enumerators, 65 were recruited for fieldwork, 15 for coding and editing duties. During the training, as a selection criterion, the trainees were subjected to a theoretical test followed by practical interviews involving real households. Classroom mock interviews and translation of the questions into Setswana were used as practice during the training because most interviews were conducted in Setswana.

### 4.5.3 Field Teams

There was eighty-nine field staff, comprising 29 supervisors and 65 enumerators. Nineteen (19) of the supervisors were permanent Central Statistics Office staff whereas the other 10 were permanent Department of Non-Formal Education staff. There were 28 teams of enumerators and one floating supervisor. The teams comprised mainly of two enumerators and a supervisor. Each team had at least one vehicle and a driver. Twentysix (26) of the 28 teams were assigned 16 EAs each during the course of the survey. The remaining two (2) teams were designated as floating teams and they got assigned work as and when the need arose. The floating supervisor also got assigned work to supervise
some enumerators particularly in areas where work was behind. Six (6) officers who were responsible for the quality control field visits supported the teams. The survey data collection was completed between 8th October 2003 and $23^{\text {rd }}$ of December 2003.

### 4.5.4 Listing of Households in the Selected EAs

During each round, each of the 26 teams listed all households in habitable permanent and private dwellings in their assigned EAs within a period of two days. Temporary dwellings such as tents, military barracks and school/institutional hostels were excluded. During the listing households were identified as either 'Occupied' or 'Unoccupied'. From the list of occupied households the enumeration teams used Systematic Sampling procedure to select 20 households in each EA.

During the first round supervisors were encouraged to accompany enumerators during their visits. This helped in enumerators gaining the necessary confidence and also helped supervisors in monitoring of interviews. From then onwards, both the team supervisors concentrated on monitoring survey resources and editing of questionnaires.

### 4.5.5 Quality Control

The quality control team during their field inspections identified some problems relating to recording and interpretation of questions and advised the field teams accordingly. Since most of the coding and editing exercise was done alongside the data collection, it was easy to contact the teams while they were still out in the field and make proper editing and coding of the items.

During field inspection some errors such, Ntshi Construction, Iverness Farm were found in the industry questions. These names did not specify, as required, what the person or company did. Some of the errors also involved some information not stated or inconsistent about age, formal school attendance, non-formal school attendance, reasons for not attending literacy classes, some tests not administered when they should have, some answers to tests stated but no marks awarded and vise-versa, etc. In all the cases affected enumerators were sent back to make the necessary corrections.

### 4.5.6 Dates of Survey Rounds

| Activities/Rounds | Period |
| :--- | :--- |
| $1^{\text {st }}$ Round | 08 Oct 2003-10 Oct 2003 |
| $2^{\text {nd }}$ Round | 13 Oct 2003-31 Oct 2003 |
| 3 rd Round | 03 Nov 2003-21 Nov 2003 |
| $4^{\text {th }}$ Round | 24 Nov 2003-15 Dec 2003 |

### 4.6 Data Processing

Data processing involved manual office editing and coding of answers to questions that were not pre-coded. It also includes data capture and online editing (cleaning of captured data).

Editing and coding started on 14 November 2003 and was completed on 31 January 2004. Training of (15) temporary staff used as editors and coders was conducted on 12 and 13 November 2003. Data capture was done seven (7) officers from 15 December 2003 to 27 February 2004. Online editing started on 12 April to 17 September 2004, and was carried out by two officers from Central Statistics Office (CSO) and Department of Non-Formal Education (DNFE)

Some of the problems encountered during data processing are as follow:

## Household Questionnaire:

- Questions on non-formal education for some people who were still attending formal or have obtained high levels of training, were not asked, probably on the wrong assumption that such people would not have gone through non-formal education
- Some people had undergone some training but the subject of training not specified
- A few managers holding high positions in business enterprises had not received any training
- Family helpers in family business were confused with housemaids and people working at own lands or cattle posts in occupation and industry questions.
- Locality and district were sometimes not specified in place of usual living

## Individual Questionnaire:

- Question 16 which asked about why people think it is important to be able to read and write was a multiple answer question but at times there was only one option answer indicated, or there were conflicting answers where there were a couple of options indicated
- Some tests had answers only but marks not indicated, and vice-versa
- There were few cases where skip instructions were missed resulting in some relevant questions not asked

### 4.7 Constraint Analysis

Ten (10) supervisors all from CSO boycotted assessment test and as a result there was no selection of best supervisors as initially planned as the 10 were sent back to office before the end of training. It was a matter of take all situation, even weak supervisors were taken but assigned areas closer to Gaborone so that they would be closely monitored.

Central Statistics Office and Department of Non-Formal Education had limited capacity in terms of staff and skills required to do the analysis within the reasonable time frame after the survey was conducted. For this reason, the University of Botswana's Research

Team in the Faculty of Education was awarded the consultancy to analyse the survey data and produce report. The team worked with staff of CSO and DNFE to build capacity.
